Labour Market Trends is available on the National Statistics website at: http://www.statistics.gov.uk/products/p550.asp.

number of people in employment has risen but the working-age employment rate remained unchanged. Based on the ILO definition, the number of unemployed people has gone unemployment rate remained unchanged. The number of people claiming unemployment-related benefits increased. The whole economy headline average earnings growth rate ing-age employment rate for September-November 2001 was 74.6 per cent, unchanged over the quarter. The number of people in employment rose by 65,000 over the quarter.

Employment rate unchanged as indicated by September-November 2001 Labour Force Survey (LFS) results.

blowment rate on the ILO definition was 5.1 per cent, unchanged over the quarter. The number of unemployed people on the ILO definition rose by 15,000 over the quarter.

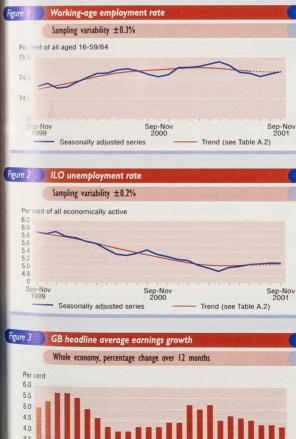

ILC unemployment rate unchanged in September-November 2001 LFS. Claimant count rate unchanged in December 2001.

- The uns The domant count rose by 3,200 in December 2001. The average rise has been 5,600 per month over the past three months and 100 per month over the past six months.
- The headine rate of growth of average earnings in November 2001 was 4.2 per cent, down 0.1 percentage point from October 2001.

this month

- November 2001: Latest LFS three-month average results, earnings;
- 2001 data: Claimant count:

2001 data: Manufacturing productivity and unit wage costs, manufacturing jobs, labour disputes.

SUMMARY

- the same period a year earlier (Table A. I).
- (Table A.3).
- November 2001 rate (Table A.3).

- point from the October 2001 rate (Figure 3, Table A.3).

Data released on or before 16 January 2002 UK unless otherwise stated. For detailed figures, definitions and concepts see the Labour Market Data section.

h but !

All figures are seasonally adjusted and for

Employment rate was 74.6 per cent among people of working age in the September-November 2001 period, unchanged from June-August 2001 but up 0.1 percentage point on the same period a year earlier (Figure 1, Table A.1).

ILO unemployment rate was 5.1 per cent in the September-November 2001 period, unchanged from June-August 2001 but down 0.2 percentage points on the same period a year earlier (Figure 2, Table A.1).

Employment was 28.23 million in September-November 2001, up 252,000 on

Workforce jobs rose by 116,000 over the year to 29.42 million in September 2001; this comprised a rise of 80,000 male jobs and a rise of 36,000 female jobs

ILO unemployment level was 1.52 million in September-November 2001. This is 55,000 lower than the same period a year earlier (Table A.1).

Claimant count up 3,200 on the month to December 2001 to 963,500. Claimant count rate in December 2001 was 3.2 per cent, unchanged from the

Economic activity rate was 78.8 per cent among people of working age in September-November 2001, up 0.1 percentage point from June-August 2001 but down 0.1 percentage point from September-November 2000 (Table A.1).

Economic inactivity rate was 21.2 per cent among people of working age in the September-November 2001 period, down 0.1 percentage point from June-August 2001 but up 0.1 percentage point from September-November 2000 (Table A.1).

GB headline rate for average earnings was 4.2 per cent in November 2001 unchanged on the same period a year earlier. This is down 0.1 percentage

Publication of the Jobcentre vacancy statistics has been deferred due to the introduction of Employer Direct (See footnote e on Table A.3, pS14).

EMPLOYMENT

- Men in employment up 28,000 since June-August 2001 to 15.55 million in September-November 2001, and women up 37,000 in the same period to 12.67 million (Figures 4 and 5, Table B.1).
- People in full-time employment up 22,000 since June-August 2001 to 21.23 million in September-November 2001, People in part-time employment up 43,000 over the same period to 7.00 million (Table B.1).
- Manufacturing employee jobs down by 146,000 in the three months to November 2001 compared with the same three months a year ago, at 3.78 million (Table B. 12).
- The LFS estimate of the total number of actual hours worked per week was 920.9 million during September-November 2001, up 0.7 per cent from September-November 2000. This is due to an increase in total employment of 0.9 per cent over the year combined with a decrease of 0.2 per cent in average actual weekly hours (Table B.21).

UNEMPLOYMENT

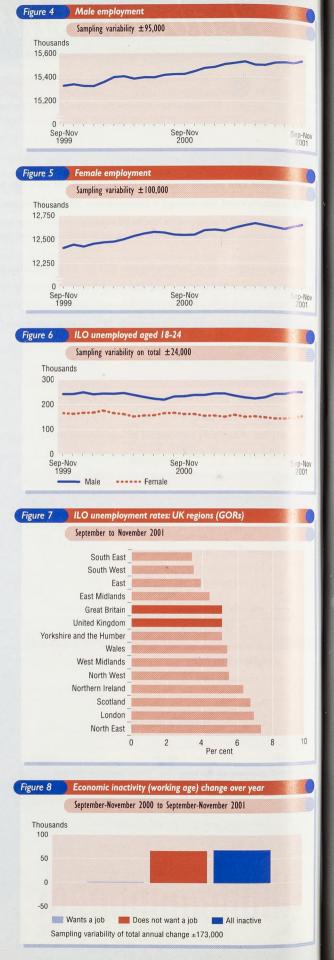

- Number of people ILO unemployed for between six and 12 months was down 11,000 over the year to stand at 217,000 in September-November 2001 (Table C. I)
- ILO unemployment over 12 months fell 53,000 over the year to stand at 359 000 in September-November 2001 (Table C.1).
- ILO unemployment for those aged 18 to 24 rose 14,000 over the year to stand at 409,000 in September-November 2001 (Figure 6, Table C.1).
- ILO unemployment rate for UK government office regions down in all regions over the year except for East of England South East Scotland and Northern Ireland. The North West region remained unchanged. The highest rate was in North East at 7.3 per cent and lowest was in South East at 3.4 per cent (Figure 7, Table A. I. I.).
- Claimant count over 12 months (computerised claims only, unadjusted) shows a fall of 44,200 over the year to stand at 168,500 in December 2001 (Table C.12).
- Total claimants aged 18-24 (computerised claims only, unadjusted) stood at 231,900 in December 2001, a fall of 6,500 since December 2000 (Table C. 12).
- Claimant count aged 18 to 24, over 12 months (computerised claims only, unadjusted) stood at 4.300 in December 2001, a fall of 500 since December 2000 (Table C 12)
- Number of people in categories affected by New Deal (computerised claims only, unadjusted)

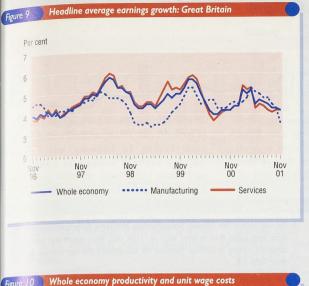

Dece	mber 2001	Change on year
18-24 over six months	32,793	-863
25 and over, 18 months to two years	28,700	-8,394
25 and over, more than two years	74,026	-31,456
Total	135,519	-40,713

ECONOMIC ACTIVITY AND INACTIVITY

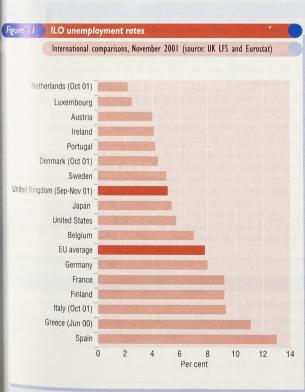

- Number of economically active people was 29.75 million in September-November 2001. Of this total, 16.48 million were men and 13.27 million were women (Table D I)
- Number of economically inactive people of working age was down 15,000 over the guarter to 7.79 million in September-November 2001. Over the year the number of economically inactive people of working age was up 69,000. The number not wanting a job was up 67,000 over the year to 5,53 million, the number wanting a job but either not seeking or not available to start work was up 2,000 over the year to 2.26 million (Figure 8, Table D.2).
- The LFS shows that the net increase of the number in employment was 252,000 in the year to September-November 2001. This was balanced by a decrease in the ILO unemployed of 55,000, an increase in the number of economically inactive of 50,000. and an increase of 246,000 in the total population aged 16 and over (Table A. I).
- Economic activity rate for men of working age was 84.3 per cent in September-November 2001, unchanged from June-August 2001, while the rate for women was 72.7 per cent for the same period, up 0.2 percentage points from the June-August 2001 period (Table D.1).

REDUNDANCIES (not seasonally adjusted)

- the time of the interview (Table C.41).

GB AVERAGE EARNINGS

- 2001 rate (Figure 9, Table E.1).
- October 2001 rate (Table F. I).
- October 2001 rate (Figure 9, Table E.1).
- rate (Table E.I).
- (Figure 9, Table E.I).

PRODUCTIVITY AND UNIT WAGE COSTS

- November 2001 compared with a year earlier.
- (Table B.32).

INTERNATIONAL COMPARISONS

- Sweden (Figure 11, Table C.51).
- Germany by 1.5 per cent.

There were 193,000 people made redundant in autumn 2001 (September-November). This compares with 163,000 in autumn 2000 (Table C.41).

Results for autumn 2001 show that ten per thousand of male employees and six per thousand of female employees had been made redundant in the three months prior to the interview. Of those made redundant, 46 per cent were back in employment at

Headline (three-month average) rate of increase in average earnings for the whole economy in the year to November 2001 was provisionally estimated to be 4.2 per cent, down 0.1 percentage point from the revised October

• The actual increase in whole economy average earnings in the year to November 2001 was 3.9 per cent, down 0.5 percentage points from the revised

In the manufacturing industries, the headline (three-month average) increase for November 2001 was 3.6 per cent, down 0.7 percentage points from the revised

The private sector services headline (three-month average) increase was 3.9 per cent for November 2001, up 0.2 percentage points from the October 2001

In the service industries the headline (three-month average) increase was 4.2 per cent in November 2001, unchanged from the October 2001 rate

• Public sector headline (three-month average) increase for November 2001 was 5.4 per cent, up 1.8 percentage points compared with a year earlier. This is down 0.3 percentage points from the October 2001 rate (Table E.1).

Private sector headline (three-month average) increase for November 2001 was 3.9 per cent, down 0.5 percentage points compared with a year earlier. This is also down 0.1 percentage point from the October 2001 rate (Table E. I).

Manufacturing output was 4.7 per cent lower in the three months ending

Manufacturing productivity in terms of output per filled job was 0.1 per cent lower in the three months ending November 2001 compared with a year earlier

Manufacturing unit wage costs were 3.7 per cent higher in the three months ending November 2001 compared with a year earlier (Table E.21).

• Whole economy output per filled job was 1.3 per cent higher in the third quarter of 2001 compared with a year earlier (Figure 10, Table B.32).

Whole economy unit wage costs were 3.1 per cent higher in the third quarter of 2001 compared with a year earlier (Figure 10, Table E.21).

UK ILO unemployment rate in September-November 2001 was 5.1 per cent, below the EU average of 7.8 per cent in November 2001 and lower than all EU countries except Austria, Denmark, Luxembourg, Ireland, the Netherlands, Portugal and

UK ILO unemployment rate among under-25s at 12.3 per cent in September-November 2001 was lower than all EU countries except Austria, Denmark, Germany, Ireland, Luxembourg, the Netherlands, Portugal and Sweden.

In EU countries there was an average increase in consumer prices of 1.8 per cent, over the 12 months to November 2001, compared with 0.8 per cent in the UK. Over the same period consumer prices rose in France by 1.3 per cent and in

Labour Market trends

VACANCIES

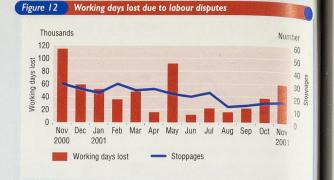

Publication of the jobcentre vacancy statistics has been deferred following the introduction of Employer Direct (See footnote e on Table A.3, pS14).

LABOUR DISPUTES (not seasonally adjusted)

- Number of working days lost in the 12 months to November 2001 is provisionally estimated to be 473,000 from 190 stoppages. Some 29 per cent of the days lost were in public administration, and 24 per cent were lost in the transport, storage and communication group.
- Number of working days lost in November 2001 is provisionally estimated to be 59,600 from 16 stoppages (Figure 12, Tables G.11 and G12).

GOVERNMENT EMPLOYMENT AND TRAINING MEASURES (not seasonally adjusted)

- As at 23 September 2001, 43 per cent of people in work-based training for young people were participating in Advanced Modern Apprenticeships, 39 per cent were in Foundation Modern Apprenticeships, 15 per cent were in other training, and 3 per cent were in Life Skills. The numbers participating in Foundation Modern Apprenticeships and Life Skills were 105,700 and 9,200 respectively; these being the highest totals to date (Table F.1).
- In the past three years, other training starts have fallen from 182,000 to 57,000. while starts on Foundation Modern Apprenticeships have risen from 1,000 to 104,000 (Table F2)
- There are traditionally more work-based learning for young people starts in July-September and 2001 was no exception: there were 85,000 workbased learning for young people starts in July-September 2001 (Table F2).
- In the 12 months between April 2000 and March 2001 work-based learning for adults leavers in England entering employment increased by 2 percentage points compared with the previous year 1999-2000. There were similar increases for all leavers gaining either a full or part qualification. The qualification rates for those who completed their training have remained constant (Tables F.3 and F.4).
- The Advanced Modern Apprenticeships qualification rate was 27 per cent in 1997-98, 36 per cent in 1998-99, 48 per cent in 1999-2000 and 49 per cent in 2000-01. The qualification rate for other training is falling. It was 40 per cent in 1997-99, 38 per cent in 1999-2000 and 33 per cent in 2000-01. This is likely to be because the more able young people, who would have been involved in other training a year or two ago, are starting Foundation Modern Apprenticeships instead (Table F.5).

- The employment rate following Foundation Modern Apprenticeships has never been higher than its latest value of 73 per cent. When leavers into governmentsupported training or full-time education are also included this rate increases to 90 per cent (Table E6)
- The proportion of individuals completing the other training programme in England remained constant at 55 per cent, of which 73 per cent found employment (Table E7)
- Some 719,400 18 to 24-year-olds had started on New Deal in Great Britain by the end of October 2001. Of these, 638,800 had left, leaving 80,600 participants at the end of October 2001 (Table F.11).
- Some 40 per cent of these leavers entered sustained unsubsidised jobs, 11 per contransferred to other benefits, 20 per cent left for other known reasons and 29 per cent for unknown reasons (Table F.14).
- By the end of October 2001, 353,300 people aged 25 or more had started on New Deal for the Long Term Unemployed in Great Britain (Pre-spril 2001 re-engineered programme) and 338,700 had left, leaving 14,500 participating at the end of October 2001. A further 73,300 people have started on the post-April re-engineered ND25+ programme by the end of October 2001 (Table F.16).
- In all, from the pre-April ND25+, 62,140 people had entered sustained jobs in Great Britain by the end of October 2001, of which 48,990 were unsubsidised jobs and 13,150 were subsidised (Table F19)

ECONOMIC BACKGROUND

- Gross domestic product (GDP) at constant market prices in the third guarter of 2001 grew by 0.5 per cent, up from 0.4 per cent in the previous quarter. Compared with the third quarter of 2000, GDP has grown by 2.1 per cent.
- In December, the seasonally adjusted estimate of retail sales volume was 130.5. This was 0.3 per cent below the November figure of 131.0 and 5.7 per cent higher than the December 2000 level
- In the three months to November 2001, manufacturing output fell by 1.9 per cent compared with the previous three months, and fell by 4.7 per cent compared with the same three months a year ago.
- Business investment was 1.6 per cent lower in the third quarter of 2001 than in the previous quarter, and 0.3 per cent lower than the third quarter of 2000.
- The balance of trade in goods in the three months to October 2001 was in deficit by £7.8 billion, down from a deficit of £8.7 billion in the previous three months and up from a deficit of £7.5 billion a year earlier.
- Excluding oil and erratics, export volumes in the three months to October 2001 were 3.4 per cent lower than the previous three months and 3.6 per cent lower than the same period a year earlier.

- Excluding oil and erratics, import volumes in the three months to October 2001 were 1.4 per cent lower than the previous three months and 1.6 per cent lower than the same three months last year
- The all items retail prices index (RPI) stood at 173.4 for December, down from 173.6 in November
- In the 12 months to December, the all items RPI rose by 0.7 per cent, down from 0.9 per cent in November
- Over the same period, the all items excluding mortgage interest payments index (RPIX) rose by 1.9 per cent, up from 1.8 in November.
- The largest downward effect on the all items 12-month rate came from changes in housing costs. A smaller downward effect from within housing came from the depreciation component. Another small downward effect came from motoring costs. The largest upward effect on the all items twelve-month rate came from changes in food prices. The slightly larger effect was for non-seasonal food while seasonal food prices rose by more in December than last year. Price changes for household goods also led to a small upward effect. In addition there was a small upward effect from household services, clothing and footwear.

If you have any comments or suggestion on the Labour Market Update please e-mail labour.market@ons.gov.uk.

The next Labour Market Update will contain the usual monthly labour market statistics.

54 Labour Market trends February 2002

Prices data in Labour Market Trends

DIE TO improved electronic access to its statistical outputs, ONS has decided to reduce the amount of prices data nublished in Labour Market Trends. beginning with the April 2002 issue. Two tables will continue to be published in Labour Market Trends: an amended version of H.11 that will contain nary data on the RPI, and a new CIIT table, H.12, that will contain headline HI data.

line with the move to electronic dissemination, all of the Retail Prices Index (RFO) and Harmonised Index of Consumer Prices (HICP) information published in the ar market data section (ppS96-S103) car be found on the National Statistics website at www.statistics.gov.uk/rpi, and statistics.gov.uk/hicp, respectively. As well as allowing free access to the user. a major benefit of electronic delivery of information is the timeliness of release. Date are available on the National Statistics website within minutes of the 9.30 am publication time of the Consumer Price ces (CPI) First Release each month.

her consumer prices data can be accessed through the RPI and HICP homepages via a number of methods designed to meet the needs of different customers. These methods are:

- Latest data. This link provides the key latest economic indicators including the RPI and RPIX for the latest month. It is updated within minutes of publication and is a useful feature for those that need headline figures within minutes of release.
- Consumer Price Indices. This is a link to the CPI First Release. It is available within minutes of the 9.30am publication time. The First Release can be viewed on screen or downloaded as a PDF file. It contains the all latest RPI and HICP data

with commentary, charts and background notes. The tables at the end of the First Release include a three- year history of data as well as detailed figures for both the RPI and HICP:

- **RP02**. This table lists the RPI since it began in 1947. It is a one-page PDF file that can be viewed on screen or downloaded.
- RP04. This table is in the same format as RP02 but instead lists the 12-month percentage changes of the RPI;
- Dataset Retail Prices Index: index numbers of retail prices 1948 to 2001. This link to StatBase® allows users to download the main RPI and HICP indices and 12-month percentage changes data into a CSV file that can be viewed through popular spreadsheet packages. This is a useful option for users that need to manipulate the published data; and
- Focus on Consumer Price Indices. This publication is presently available on the website on the first Monday of the month after the First Release. It is planned that this will be brought forward to the Monday after publication to meet better our customers' needs. This PDF file contains detailed data for the RPI and the HICP It is ideal for the user that needs

<i>Labour Market Trends</i> Table	Focus on CPI equivalent	CPI First Release equivalent

• Users needing help in accessing RPI data can call the RPI Helpline, tel. 020 7533 5874, or e-mail rpi@ons.gov.uk. For assistance with the HICP, tel. 020 7533 5819 or e-mail hicp@ons.gov.uk.

Website developments

IMPROVEMENTS HAVE recently been made to the labour market theme pages on the National Statistics website. These improvements are designed to make the pages easier to navigate, and to provide better access to the increasing amount of material available on the site.

Restructured web-pages

The labour market theme homepage now provides links to latest releases, an overview of the labour market, useful guides to labour market statistics, and links to other related themes. It also offers links to topic homepages structured around the key areas of labour market statistics:

News and research

NATIONAL STATISTICS NEWS

detailed price information. The layout of this publication is also replicated in TimeZone. TimeZone allows users to download individual series into a CSV file

On the RPI homepage, there are also links to:

- A Brief Guide to the RPI. This guide provides a useful summary of how the RPI is calculated and what it is used for;
- the RPI Technical Manual which is the definitive explanation of how the RPI is produced; and
- future publication dates and background articles, including information on methodological issues; budget effects on the RPI: and items used as price indicators, can all be viewed and downloaded

Users may find it useful to bookmark their preferred method of access to their Internet browser. This will allow easy access without having to navigate around the site each time data are required.

The following table shows where to access the RPI and HICP data that are published in the H-tables. This table will be replicated under the new tables to remind users of where to access the data

employment; unemployment and the claimant count: economic activity; pay and earnings; vacancies and redundancies; and industrial relations. Each provides a guide to the available data, articles, publications and data sources relevant to the topic with direct links.

The navigation pane on the left-hand side

News and research

of the screen is identical on all of the labour market pages, and allows users to move quickly between the different areas within the theme. It provides links to all of the topic pages, as well as pages of more general user interest such as 'what's new, products and services' (including StatBase®), and 'contacts and consultation'.

Labour market statistics First **Release Historical Supplement**

In January 2002 ONS published on the National Statistics website a historical supplement to the labour market statistics First Release. This web only supplement provides full historical data for the series published in the First Release in Excel

spreadsheets, which can be downloaded or viewed on screen.

The supplement contains data compiled from a wide range of sources and provides information on employment, unemployment, economic activity and inactivity, earnings, productivity and unit wage costs. It also contains a number of summary tables including Labour Force Survey and subnational summaries.

The publication is aimed at those with an interest in key labour market statistics over the entire economic cycle, and the Excel format allows for further manipulation and analysis. It also meets the needs of users unfamiliar with the First Release and navigation through

StatBase® and Timezone.

Social Trends 32

THE OCCUPATIONAL composition of the population changed during the twentieth century according to the recently published edition of Social Trends. There was an upward trend in the share of professional, managerial and supervisory grades among working-age men and an increase in the numbers of women in higher socio-economic occupations. There has also been an industrial shift. In 2001, just over one in five male employee jobs were in manufacturing, compared with one in three male jobs in 1981, while the largest increase, in both male and female jobs, has been in financial and business services, which now account for about one in five jobs.

Social Trends draws together statistics from a wide range of government departments and other organisations to paint a broad picture of British society today and how it has been changing. Each of the 13 chapters focuses on a different social policy area, described in tables, charts and text. Chapter 4 deals with aspects of the labour market. This chapter makes widespread use of ONS surveys, especially the Labour Force Survey, and other sources such as Eurostat, the Employment Service and the Department of Trade and Industry. Other facts about the labour market highlighted in Social Trends 32 include the following:

- in spring 2001, of the 36.6 million people of working age in the United Kingdom, 27.3 million were in employment;
- employment rates for men have gradually fallen from 94 per cent of the workingage population in 1959 to 80 per cent in

2000, while, among women, employment rates have risen from 47 per cent to 70 per cent:

- the proportion of people's lifetime spent in the labour force is decreasing as the increase in life expectancy means more years are spent in retirement;
- in Great Britain, around a fifth of Pakistani/Bangladeshi people in employment were self-employed in spring 2000 to winter 2000/01, compared with one in ten people from the White ethnic group and less than one in ten people from the Black ethnic group;
- in the United Kingdom in spring 2001, there were 6.8 million people of working age with long-term or work-limiting disabilities, of whom just over half were economically active. Among the economically inactive, disabled people were more likely than non-disabled people to want a job;
- overall, about 7.9 million people were classified as economically inactive in spring 2001, about the same number as in 1996.
- within the EU the highest levels of employment for young people aged 15 to 24 were in the Netherlands and Denmark (both almost 70 per cent). United Kingdom and Austria were both over 50 per cent and the lowest employment rates were in Greece, France and Italy (less than 30 per cent);
- of those young people in Great Britain leaving the New Deal between January 1998 and August 2001, 59 per cent went into unsubsidised and sustained jobs:
- around a fifth of employees in the UK working full time and almost a quarter of

those working part time had adopted some type of flexible working arrangement in spring 2001;

- the number of employees with temporary work increased during the early 1990s and has since stabilised at around 1.7 million people:
- promotion played a substantial role in workers' mobility, and accounted for about 36 per cent of position changes each year. The promotion rates of younger workers were higher than hose of older workers, but the gender differences were small; and
- in spring 2001, about 6 per cent of fulltime employees were looking for a new job, with more than a fifth citing unsatisfactory pay as the trigger.

Other chapters in the publication cover population; households and families; education and training; income and wealth; expenditure; health; social protection; crime and justice; housing; environment; transport; and lifestyles and social participation. Recent editions of the book have also included articles focusing on topical social issues, for example drugs, and the 2001 Census. In Social Trends 32 the article concentrates on one particular social group: children. It presents an overview of the social trends that have affected children in the United Kingdom since the 1980s.

• Social Trends 32 is published by The Stationery Office, PO Box 29, Norwich, NR3 1GN, tel. 0870 600 5522. ISBN 011 6214724. £39.50. The interactive PDF version of the publication can also be accessed at www.statistics.gov.uk/socialtrends.

OTHER NEWS

Young people in Europe

quite diverse experiences within the market, according to a report lahou. published by the Institute for recen and Economic Research. In the Socia of all young people were in work UK ha ge of 19 years and one month in hy the hile half of young Spanish and 1994. people did not have a job until Italia re aged 24 years and four months. they V eport entitled Young People's Lives: The of Europe brings together the from nearly 25,000 individuals ween 17 and 25 who took part in pean Community Household Panel ECHP). In most of the countries interviews first took place in 1994. ria, Finland and Sweden, interviews rst carried out in 1995, 1996 and spectively.

ECHP, carried out in the 15 EU The states, is the first survey to collect vide variety of information on such number of young people. Other examined in the report include onal achievements, patterns of ormation and standards of living.

eport argues that the late entry of alians into the labour market can be d by the fact that they spent more the education system than their UK Around two-thirds of Italians were ducation at the age of 22, compared than a tenth of UK people.

everal countries including the In Vethe ands, Ireland and the UK, 17 to 20s earned only about 50 per cent of es available to older employees, Belgium, Austria and Italy, 17 to while olds earned up to 70 per cent of the paid to older workers. Having a niversity degree had a varying impact upon salary.

Young men in the UK were more likely than anywhere else to work long hours:

YOUNG PEOPLE across Europe have around one in three of those with a full-time job worked 50 hours or more, compared with less than one in ten in Sweden. In Europe as a whole, young people under the age of 25 were more likely than older workers to be in insecure employment, e.g. on a fixed term contract or in casual work: half of all 17 to 20-year-olds and a third of those aged 21 to 25. Spain had the highest proportion of workers on insecure arrangements (77 per cent of all young workers). The proportion of young workers on insecure contracts in Finland, France, Portugal and Greece was also high (at 37 per cent or more). The young workers who were best protected were in Austria (15 per cent), the UK and Germany (24 per cent).

> Although young Italians spent longer in the education system than their UK counterparts, they also spent longer periods in unemployment. Italy, Greece and Spain had the highest levels of unemployment among young men (over half of all young men in these countries in the 17 to 20 age group and over a third of all those aged 21 to 25 were not in paid work), while Austria and the Netherlands had the lowest levels.

In Italy over 50 per cent of men and women who turned 20 in the 1960s cohort and more than two-thirds of the those in the 1980s cohort were unemployed before taking their first job, compared with less than 10 per cent in Germany. Over this period, the rise in initial unemployment was comparatively steep in France, Denmark, the UK and Spain. In each of these countries the rate of joblessness before people's first job was at least five times higher in the 1980s cohort than in the 1960s cohort

In general, countries with high levels of male unemployment among the young also had relatively high rates of unemployment in the older age groups. The exceptions were in Belgium, Greece and Sweden,

Motherhood and careers

FEWER WOMEN are staying in fullme employment after the birth of their first baby than previously suggested, according to new research funded by the Economic and Social Research Council. Only one in ten women maintained uous full-time employment during he first 11 years after birth, and these men were distinctive in terms of their cupations, they had smaller families

and experienced more marital disruption

The longitudinal data showed that there than other mothers. had been an increase over the past two From a survey of around 5,000 mothers decades in the proportions of women who: of 11-year-old children (drawn from DSS returned to work within one year of child benefit records), researchers at Oxford childbirth (from 24 per cent in 1979 to 67 Brookes University collected information per cent in 1996); were working full time on their working hours, employment status within one year of having a baby (from 5 and continuity at three points in time (1992, per cent to 24 per cent); and had children 1993 and 1999). This enabled them to draw under the age of five and were in paid work up a work history typography. (from 28 per cent in 1980 to 53 per cent in

News and research

where youth unemployment was much higher than might have been expected from the position of men in their thirties and in Ireland, UK and Denmark, where unemployment rates among young men were much lower than might be expected.

The authors go on to explain how interpreting the economic activities of young women is more difficult than for young men, because women who had left education might have been employed, or unemployed and looking for work, or might count themselves primarily as homemakers. Unemployment rates fell with increasing age for women, but the number of women working full time on family care increased. The report explains how the total proportion of young women concentrating on homemaking in any country will depend on the proportion who have children, and the economic and social conventions in each society (this mediates the relationship between the family and the labour market). The proportion of young women engaged in family care ranged from under 2 per cent in Denmark and Belgium to over 15 per cent in Greece and the UK, with the proportion in all other countries being within the range of 5 and 8 per cent.

The authors conclude that despite these diverse labour market experiences, young people within Europe still share some common concerns. A changing youth labour market has led to young people spending longer in education, being more likely to be unemployed and increasingly likely to have an insecure contract rather than a 'job for life' as was the norm for their parents' generation.

• Young People's Lives: A Map of Europe, by Maria Iacovou and Richard Berthoud is published by the Institute for Social and Economic Research (ISER). The report is available free at www.iser.essex.ac.uk.

News and research

1999). Nevertheless, the extent and

continuity of women's full-time employment

after they became mothers had been over-

stated. More than ten years after the birth of

a first baby, fewer mothers were in full-time

employment than had been within the first

12 months of that birth. Mothers were still

reluctant or unable to mix full-time jobs with

motherhood, and the explanation of

women's labour market choices after

childbirth depends as much on understanding

the constraints which affect them as it does

The research suggested that mothers fall

into four categories: those who worked

continuously full time; those who worked

continuously part time; those who mixed

full-time and part-time work; and those who

had not been employed since the birth of

their first child. Four stereotypes of modern

motherhood were then drawn from these

differing work histories. Women who fell

into the 'I want a career' group typically

returned to work within 12 months of their

first child and stayed in full-time work

thereafter. Of these mainly professional

on understanding their preferences.

women, many had experienced marital disruption and, of those with partners at the birth of their first child, only 73 per cent remained with the same man.

The second stereotype, 'I want children and a job' also returned to work within a year of giving birth and stayed employed, but worked part time in order to balance work and family. Of these women, 90 per cent were married and 92 per cent of those with husbands or partners were still living with the father of that child.

The third group included the 'my family comes first' type. They had work histories that mixed part-time and full-time work and spending time at home. These mothers were less likely to return to work within a year of having their first baby and their spells in the labour market were more intermittent. These mothers also included some of the youngest in the study who did not have such stable partnerships. They also achieved much less in the labour market than other mothers.

The final group of women, 'my family is my job', gave up paid employment when they became mothers. One in five of these women had expected to return to work so after the birth of their first baby, but the fa that they did not subsequently do so u often related to difficulties finding work affordable childcare. These women had the largest families and 84 per cent remain with the father of their first child.

The study also found a shift in wome attitudes towards work and family life a the balance of roles between the sexes. T attitude that married women work for n money has almost disappeared with only per cent of women agreeing with th statement in 1999, compared with around fifth of women in 1980. Concomitant wi this, less than a tenth of women agreed 1999 that they should stay at home in tin of high unemployment, compared with third in 1980.

lob vacancies in Greater Manchester

THE QUALITY of many of the jobs on offer in 2001 at the lower end of the labour market was poor, according to a recent report by the Greater Manchester Low Pay Unit. And despite the introduction of the national minimum wage, weekly incomes remained low with many individuals and households relying on social security benefits and in-work tax credits.

The report Jobwatch 2001 is based on data from a survey of Jobcentre vacancies which has been carried out in Greater Manchester since 1989. The report describes the job opportunities available to local unemployed people and informs debate about government labour market policies. The inclusion of historical data provides an overview of key changes in the local labour market.

The survey, undertaken in April 2001, covered all vacancies displayed in ten Jobcentres plus 12 per cent of unfilled vacancies from the remaining Jobcentres in Greater Manchester. In total the survey covered at least 46 per cent of local Jobcentre vacancies.

In April 2001 there were 4,067 jobs on display in Greater Manchester Jobcentres. This was a rise of nearly 5 per cent on the previous year and is the highest number of vacancies since the survey began. Around 2,500 jobs were full time and 1,500 were part time (under 30 hours a week).

Catering, office, cleaning and shop work accounted for more than half of all vacancies on offer. These occupations tend to be associated with female employment and are, in general, low-paid occupations. Many of the jobs traditionally seen as male (e.g. skilled, driving, security, motor trade, warehouse and engineering) accounted for a lower proportion of jobs in the survey (less than a fifth of all vacancies).

Since 1989 the number of catering vacancies has doubled and in 2001 represented 17 per cent of all jobs on offer. In 1989 engineering vacancies represented 5.3 per cent of all vacancies compared with only 1.8 per cent in 2001. Between 1989 and 2001 the number of security jobs has risen seven fold. Other higher-paid occupations such as managerial, professional and nursing had few vacancies. In total, these three categories represented only 5.3 per cent of all vacancies.

Temporary vacancies made up 7.8 per cent of the total. This was a reduction on the previous year but almost twice the figure for 1989. Many of the temporary jobs were in occupations which are traditionally higher paid, such as skilled and professional occupations. When temporary jobs were removed from the analysis the effect was to reduce both average hourly and weekly pay.

The average hourly rate of pay for fulltime jobs was £5.28 an hour and for parttime jobs, £4.30 an hour. In 1998, the year before the introduction of the national minimum wage, more than 42 per cent of all jobs were below the minimum. By 2001 this had fallen to 0.6 per cent. Nearly six out of ten jobs in the survey were paying above the present adult minimum wage

level of £4.10 six months before his ra came into force, although six in ton part time jobs were paying below £4.10.

Many jobs paid at levels requiring supplementary assistance from social secur or in-work benefits. Around a quarter of th vacancies on offer paid below the Nation Insurance lower earnings limit of £72 a wee and about three-fifths of part-time vacancie paid below this level. This means en ploye taking them would not be able to clai contributory social security benefits such as statutory sick pay, statutory maternity pa Jobseeker's Allowance and a state pensio Almost all jobs paid below £368.53, the level at which a couple with two children paying average council house rent and council ta stop receiving Working Families Tax Credit.

Average hours of work for full-time workers were 38.4 hours per week and for part-time workers, 15.9 hours per week. More than a fifth of jobs were for less than 16 hours a week, while almost a third of job were for between 36 and 40 hours a week.

The authors conclude that there has been no real improvement in the quality of jobs on offer at Jobcentres and that current vacancies continue to be low-paid, with low skills levels which require tax credit top-ups to make them viable.

· Jobwatch 2001: A Survey of Vacance Greater Manchester Jobcentres is ava from the Greater Manchester Low Pay L 23 Mount Street, Manchester, M4 4DE, I 0161 953 4078. £10.

A selection of recent Parliamentary Questions concerning labour market statistics answered in letters from Len Cook, National Statistician. The date on which the answer was given is at the end of each PQ.

Manufacturing jobs

INDSAY HOYLE (Chorley) asked the Secretary of State for Trade and Industry any (a) management and (b) shop hs in manufacturing have been lost in cashire and (ii) the United Kingdom (i) La in each of the last three years.

COOK: The Labour Force Survey (LFS) provides estimates of the numbers of employed in manufacturing in hire and the United Kingdom. The LFS does not classify occupations in terms of

'management' and 'shopfloor'. However, it does provide estimates of the numbers of people employed in manufacturing by social class based on occupation (formerly known as Registrar General's Social Class), up to and including winter (December to February) 2000-01. The attached table gives the LFS estimates of the numbers of people employed in manufacturing in Lancashire and the United Kingdom for winter (December to February) 1997-98 to winter (December to February) 2000-01 by social class.

All persons employed in manufacturingª by social class; United Kingdom and Lancashire; winter ber to February) 1997-98 to winter (December to February) 2000-01, not seasonally adjusted

Graduate earnings

STEPHEN HEPBURN (Jarrow) asked the Chancellor of the Exchequer what were the average annual earnings for graduates in (a) 1999, (b) 2000 and (c) 2001.

JOHN KIDGELL: I am replying in the National Statistician's absence. The Labour Force Survey (LFS) provides estimates of gross weekly earnings for graduates of g age (i.e. men aged 16-64 and women aged 16-59) who have a first degree tion or higher.

The figures for summer (June to August) 1999, 2000 and 2001, are given in the table

Average gross weekly earnings of working-agea graduates who are full-timeb employees; United Kingdom; summer (June to August) 1999, 2000 and 2001, not seasonally adjusted

	Average gross week	ly earnings (£)

Parliamentary questions

Unemployment

JOHN BERCOW (Buckingham) asked the Chancellor of the Exchequer to provide a breakdown for each of the last two Parliaments of the change in the number of 18 to 24-year-olds unemployed for over six months.

LEN COOK: The Office for National Statistics (ONS) compiles statistics for unemployment from surveys following the internationally standard International Labour Organisation definition. ONS also compiles statistics of claimants of unemployment- related benefits. The claimant count consists of all people claiming Jobseeker's Allowance or National Insurance credits at Employment Service local offices. They must declare that they are out of work, capable of, available for and actively seeking work during the week in which the claim is made. The table below provides a breakdown of the available figures.

United Kingdom: changes over the last two parliaments for 18 to 24-year-olds (A) ILO unemployed for six months or more: (B) claiming unemployment benefit for six months or more

	Number
ILO unemployment ^a six months or more dura LFS reference period ^b	ation
March to May 1992	364,000
April to June 1997	189,000
May to July 2001	104,000
Change March to May 1992 to April to June 1997	-175,000
Percentage	-48.1
Change April to June 1997 to May to July 2001	-85,000
Percentage	-45.0
Claimant count ^{c,d} claiming for six months or Claimant count reference month ^e	more
April 1992	358,114
May 1997	169,498
June 2001	40,089
Change April 1992 to May 1997	-188,616
change riphi 1992 to May 1997	
Percentage	52.7
• •	52.7 -129,409

a Seasonally adjusted.

b As asked for in the question, the periods shown are centred around the General Election dates. It would be more useful to make comparisons between consecutive three-month periods.

c Not seasonally adjusted.

d Monthly claimant count data by age and duration are on the basis of all claims for April 1992 and computerised claims only for later years.

e For data that are not seasonally adjusted, comparisons should normally be made between data for the same month each year. For this reason, comparisons between different months should be used with caution.

The economic activity of young people is closely linked to their participation in full-time education (FTE) although young people can be in both employment and education. It is worth noting that after leaving full-time education some may participate in part-time study or some other form of nongovernment-supported training. Table 1 shows the economic and educational status in autumn 2001 of people who were aged between 16 and 19 on the previous 31 August.

- Of the 2.9 million people aged 16-19, 1.6 million (54 per cent) were in full-time education in autumn 2001.
- Women were more likely than men to be in full-time education (58 per cent compared with 51 per cent).
- Of young people not in FTE 86 per cent were economically active, of whom 18 per cent were ILO unemployed.
- For those in FTE, 49 per cent were economically active, of whom 14 per cent were ILO unemployed.

Labour Market trends

2 Women in the labour market

The Labour Force Survey provides information on the labour market status of and type of employment undertaken by women with different family responsibilities (Table 2).

- There were 12.1 million women of working age in employment in autumn 2001.
- The employment rate for working-age women was 69.5 per cent (compared with 79.6 per cent for working-age men).
- Among women with dependent children, those whose youngest dependent child was 0-4 years of age had the highest rate of ILO unemployment (5.7 per cent).

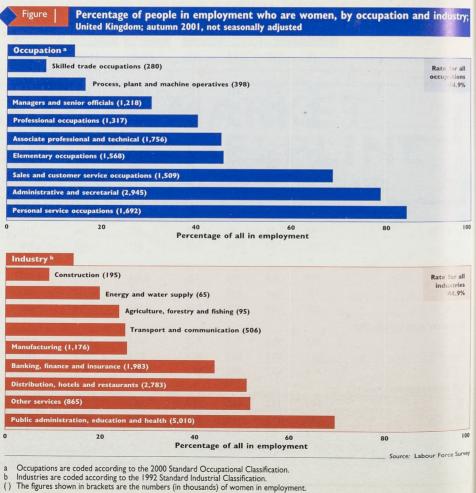

Figure 1 displays the percentage of people in employment who are women, by occupation and industry.

- More than half the people who worked in the personal service occupations, administrative and secretarial and sales and customer service occupations were women.
- There was a clear distinction between industries such as agriculture, forestry and fishing, construction, transport and communication, energy and water supply and the manufacturing industries where less than one third of all in employment were women, compared with most of the service industries where more than half were women.
- More than two-thirds of those in public administration, education and health were women.

Many companies telephone the Labour Market Statistics Helpline to enquire whether LFS data can help them to assess the levels of sickness in their company against the national background. The LFS collects information on people who have been absent from work due to sickness or injury for at least one day in the reference week.

• There were 2.2 million working days lost to sickness or injury per week in the autumn quarter. This accounts for 2.0 per cent of the total scheduled working davs.

Figure 2 shows the percentages of employees in different occupational and industry groups in autumn 2001 who were absent from work at least one day in the reference week due to sickness or injury.

- For all employees, this rate was 3.4 per cent.
- The sickness absence rate varied between occupations from 2.4 per cent for managers and senior officials to 3.9 per cent for sales and customer services.
- The sickness absence rate also varied between industries from 2.8 per cent for other services to 3.7 per cent for public administration, education and health.

Table 3 gives the number of days off these employees had in the reference week. It is worth noting that a day off by a parttime employee may not be equivalent (in terms of lost output) to a day's absence by a full-time employee.

- 835,000 employees had at least one day off in the reference week due to sickness.
- In autumn 2001, 3.7 per cent of women employees took at least one day of sickness absence (436,000), compared with 3.0 per cent of men (395,000).

3 Sickness absence (cont.)

• Of those who were off sick in the reference week, 39 per cent were away for just one day.

• Of those who were off sick in the reference week, 24 per cent were unable to work for five to seven days.

Figure 3 shows the occurrence of sickness absence for employees by government office region.

- The areas with the highest rates of sickness absence were the South West and North East with 3.7 per cent and 3.6 per cent, respectively.
- O Northern Ireland had the lowest incidence of sickness absence with just 1.7 per o cent.

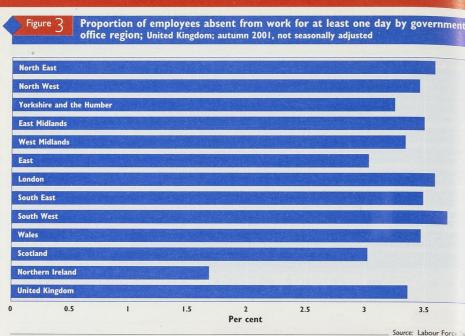

Table 4 compares the occurrence of sickness absence for employees by public or private sector and full-time or part-time for autumn 2001.

- Overall, full-time employees have higher rates of sickness absence than part-time employees (3.5 per cent, compared with 2.8 per cent). • Those in the public sector
- had higher sickness absence rates than those in the private sector.

Figure 4 shows the occurrence of sickness absence of employees by age group.

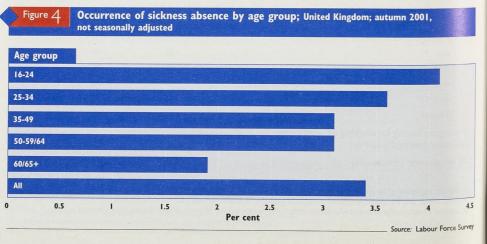

- In autumn 2001 a higher proportion of employees aged 16 to 24 were absent from work due to sickness or injury than any other age . group
- Employees above pensionable age had the lowest rate of sickness absence at 1.9 per cent.

Employees aged under 50 were more likely than average to take one day off per week sick, while those aged 50 years and over were more likely to take five days or more off.

Source: Labour Force Survey

A common request from callers to the Labour Market Statistics Helpline is for LFS data on the length of time those in employment have worked for their current employer. Table 5 shows the length of time men and women had worked with their current employer in summer 2001. This is not the same as the total time employees stay with the same employer.

- In summer 2001 there were 28.3 million people in employment in the UK. Of these, nearly a third had been with the same employer for less than two years. Men were less likely than women to have been with the same employer for less than two years (30 per cent, compared with 35 per cent).
- Nearly twice the proportion of men compared with women had stayed with the same employer for 20 years or more (15 per cent, compared with 8 per cent).

Figure 5 shows the proportion of people who had been with the same employer (or continuously self-employed) for less than two years by broad occupation and industry categories. This can give indications of areas where job turnover is greatest or the workforce is youngest.

- Just over half of all those in employment in sales and customer service occupations had been with the same employer for less than two years. At the opposite end of the scale, a fifth of managers and senior officials had been continuously employed for less than two years.
- Between industries, the proportion of people who had been continuously employed for less than two years ranged from 23 per cent in the agriculture and fishing category to 42 per cent in the distribution, hotels and restaurants category.

🚯 Looking for a different or additional job

The LFS asks people who are in employment whether they are looking for a different or additional job, and their reasons for doing so. Table 6 shows the number of employees and selfemployed people who were looking for a different or additional job in summer 2001.

- In summer 2001, 1.5 million people (5.4 per cent of all employees and self-employed) were looking for a different job and 0.2 million (0.7 per cent) were looking for an additional job.
- Men were more likely than women to be looking for a different job (5.5 per cent compared with 5.2 per cent). However, the reverse was true for people looking for an additional job (0.6 per cent, compared with 0.9 per cent).

Table 7 lists the main reasons given by employees and selfemployees for looking for a different job only.

- Almost a quarter of people who were looking for a different job said that their main reason for doing so was that their pay was unsatisfactory.
- Men were less likely than women to say they wanted longer hours than in their present job (3 per cent, compared with 6 per cent)

The LFS also asks people who are looking for a different or additional job what they consider to be their main method of jobsearch. Figure 6 shows the answers that were given in summer 2001, by sex.

- Some 47 per cent of all employees and self-employed people looking for a different or additional job said they used the 'situations vacant' column as their main method of jobsearch. Women were more likely than men to use the situations vacant column (51 per cent, compared with 44 per cent).
- Included in the 19 per cent who gave an 'other' method of jobsearch were 8 per cent who gave 'being on the books of a private agency' as their main method.

68 Labour Market trends

Economic inactivity and the labour market

By Catherine Barham, Labour Market Division, Office for National Statistics

points

The number of economically ve people of working age has from double the number of loyed in 1984 to five times mber in 2001. This is due to a lower level of unemployment of compared with 1984, and ity remaining almost constant. e trends in economic inactivity

en and women show different ns. Inactivity rates for women declined from 35 per cent in to 28 per cent in 2001 while men the inactivity rate has ased from 12 per cent to 16 ent over the same period.

e composition of the inactive has changed over time. For there has been an increase in proportion who are long-term or disabled and for women has been a decline in the proon who are inactive due to DO ng after a family or home. 100

nily responsibilities are the difference in economic inactivies between men and women. ng women aged 25-34, 72 per were inactive as a result of famcent me responsibilities compared ily/ only II per cent of men of the same age.

• Sickness and disability is a major reason for economic inactivity among males. Among inactive men aged 25-34, 43 per cent were longterm sick or disabled. This proportion increases to 64 per cent among men aged 35-49.

• Certain groups of people classified as inactive can be considered to be more attached to the labour market than others. In particular, those who satisfy the two criteria of wanting a job and looking for work, but who are unavailable to start, are more likely to move into economic activity than others within the inactive group.

This is the first in a series of articles focusing on economic inactivity. It gives background information on the characteristics of inactive people, reasons for inactivity, and compares inactivity rates for different subgroups.

Introduction

THE UK labour market is often described in terms of classificatory groups of people, as measured by the Labour Force Survey. The main three are the employed, the ILO unemployed and the economically inactive. Headline figures have, in the past, focused on the number of employed and unemployed in the labour market and relatively little attention has been paid to those people who are classified as economically inactive. Changes in inactivity rates are, however, a key part of the impact of labour supply on potential output growth. This is due to the large number of potential workers among this group. It is important to recognise that this group may well be less isolated from the labour market than the name suggests.

National Statistics feature

This purpose of this article is to identify.

- trends in the groups of people classified as economically inactive;
- the reasons why people are classified as inactive; and
- the characteristics of those in inactivity.

Trends in the economically inactive

A brief study of the trends in the unemployed and economically inactive groups over the past decade or so shows a number of interesting changes (Figures 1a and 1b). It should be noted that the denominators for the unemployment rate and the inactivity rate are slightly different (see Box 1), and

so in order to compare directly the changes in proportions classified as unemployed and economically inactive, the rates shown in *Figure 1b* have both been calculated as percentages of the working-age population. Although the focus of this article is on the inactive population of working age, in terms of absolute figures the inactive population aged over 59 for women and 64 for men constitutes 55 per cent of all those in inactivity. This group, despite its size, is clearly less important when considering the potential of these people to enter into economic activity.

The proportions of the working-age population who were unemployed fluctuated at around 8 per cent in the late 1980s and then dropped to a low of 6.3 per cent in 1990. During the economic recession this proportion rose to a peak of 9.6 per cent in spring 1993, and has been falling ever since. In contrast, the economic inactivity rate has been more constant over this time. During the boom period, which resulted in a fall in unemployment in the late 1980s, inactivity rates tracked the proportion of the working-age population who were unemployed by falling slightly. Initially, as the proportion who were unemployed rose so did the inactivity rate, but, latterly, during the economic upturn, there has been a much larger fall in the measure of unemployment than for the inactivity rate. By spring 2001 unemployment as a proportion of the working-age population had fallen to a low of 3.2 per cent, while inactivity was still around 22 per cent unchanged since 1993. It should be noted that these changes might well reflect the different stages in the economic cycle which have occurred over the period. It is possible that the two groups of unemployed and economically inactive have different cyclical patterns and therefore the fluctuations in the size of the ratio between these two groups may be due to these variations

These changes to the labour market have been a cause for concern for labour market analysts, as a number of recent articles have highlighted.^{1,2,3} They have also been the subject of a recent paper produced jointly by HM Treasury (HMT) and the Department for Work and Pensions (DWP).⁴ Many

Box | Definitions

Economically inactive

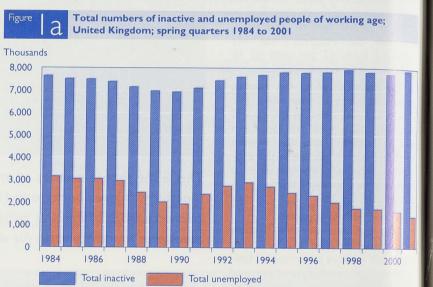

These are people who are not in work, but who do not satisfy all the criteria for ILO unemployment (wanting a job, seeking in the last four weeks and available to start in the next two), such as those in retirement and those who are not actively seeking work.

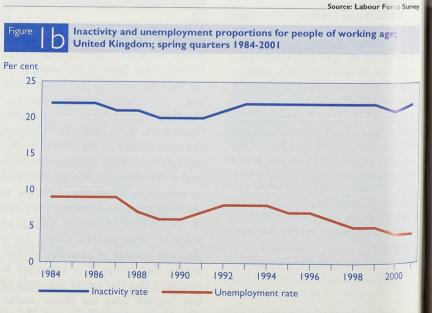

Economic inactivity rate

The number of economically inactive people as a percentage of the total population aged 16 and over. Can be calculated for any population group.

ILO unemployment rate

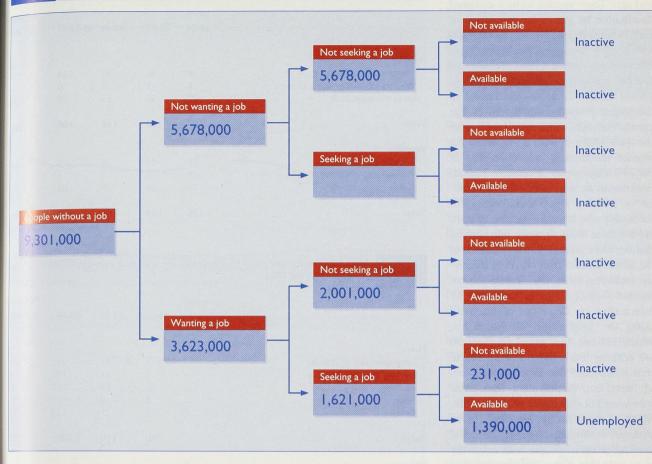

The percentage of economically active people who are unemployed on the ILO measure. Can be calculated for any population group.

ource: Labour Force Survey

Hierarchy of criteria used to classify those who are unemployed and those who are economically inactive; United Kingdom; spring 2001, not seasonally adjusted

of these articles focus on the impact of these changes on the labour market given the size of the inactive group. gure 1a gives an indication of the difference in absolute size of these two os, the number of inactive people of working age being over five times that of the unemployed in 2001. In 1984, inactive people outnumbered the unemployed by a ratio of just over two to one. This growth in the relative size of the inactive group is particularly remarkable when it is considered that this has occurred among the population of working age. Demographic changes resulting in an increase in the number of older people above state pension age in the UK population cannot therefore fully explain these changes.

nactivity criteria

The Labour Force Survey (LFS) collects information from respondents on their reasons for inactivity based on a number of criteria. These criteria of wanting a job, being available to start, and seeking work are based on the ILO definition of unemployment. Those people who are classified as unemployed have, by definition, met all three conditions. This means that inactivity is a result of not satisfying one, two or all three of these criteria.

Although these groups are mutually exclusive, the proximity of those in the inactive group to the employed and unemployed groups varies. For example, someone who is looking for a job but has not yet arranged childcare and so is unavailable to start is classified as inactive, alongside someone who is looking after an elderly relative on a full-time basis. For this reason it is important to break down the various groups within the inactive category to try and get the full picture of the reasons why these people are not economically National Statistics feature

Source: Labour Force Survey

active. Figure 2 shows how the inactive group can be broken down by the three main criteria of wanting, seeking and being available to start. An indication is given of the number of people in each of these groups in spring 2001.

On the right-hand side at the bottom of the diagram are the unemployed, who satisfy all three criteria of wanting a job, seeking a job, and being available to start. These numbered around 1.4 million in spring 2001. All the other groups on the right-hand side of the diagram are classified as inactive. Some of the groups are not filled in with figures as the sequence of questions on the LFS does not ask about all three criteria if a classification can be made already, i.e., those who do not want a job and are not seeking one are not asked whether they are available to start work. Similarly, people who want a job but are not looking are not asked if they are available to start.

Economic inactivity in the labour market

Table 1 shows a broad breakdown of inactivity according to criteria by sex and age. There appears to be a u-shaped distribution by age of the proportion of people who are inactive because they do not want a job, particularly for men. During term time it would be expected that the majority of students would not want a job and therefore would make up the largest proportion in the 16-24 age group. For men, those aged 35-49 were the most likely to want a job, while for women the highest proportion was in the 24-34 age group. It could be considered that those who satisfy the two criteria of wanting a job and looking for work, but who are not available to start. are the most likely to move into activity and therefore relatively more attached to the labour market than others in inactivity, including those who want a job but are not looking. This is supported by information on flows out of inactivity using the longitudinal LFS datasets, which indicate that those people who are seeking work but not available to start are around five times more likely to move into employment than those who were not seeking or wanting work. Many of these people are likely to be students. It should, however, be noted that the group of people with relatively high transition rates into employment constitutes a relatively small proportion of all those in inactivity. More detail on transition probabilities out of inactivity will be covered in a future Labour Market Trends article. For more information about the concept of labour market attachment see pp407-14, Labour Market Trends, October 1997.

Reasons for economic inactivity

Within the broad breakdown by wanting/seeking/availability, the LFS asks people the reasons they are not seeking, not available, etc., using certain categories required by Eurostat. The main groups are people looking after the family and home, students, and those who are temporarily or permanently sick. These main groups of people can be identified in each of the wanting/seeking divisions. The majority of students, for example, are classified into the top row of the diagram as

not wanting a job, not looking, and not being able to start.

The changes in these groups can also be looked at over time (see Figure 3). Among men of working age, there appears to have been a shift in the make-up of the inactive group over the past 15 years. Students were the largest group within the inactive, making up over a third of all those in the group in 1984. Since 1987 this group has been overtaken by those classified as longterm sick or disabled, who made up 41 per cent of all those in inactivity in 2001. There has also been a fairly dramatic decline in the proportions of discouraged workers, from 9 per cent in 1986 to 1 per cent of the total in 2001.

There have also been some changes in the make-up of the inactive group among working age women. A sharp decline in the proportions looking after the family and home has been accompanied by increases in the long-term sick group, although this is still much lower than for men. This increase has been particularly marked since 1993 when 14 per cent of those in inactivity were long-term sick, compared with 20 per cent in 2001.

Table 2 shows a breakdown of the inactive population according to reasons for inactivity and age group. As would be expected, the largest group of inactive people among the youngest age groups are students, who make up 83

itasets for 1984 to 1991; spring quarters 1993 to 2001. Due to a questionnaire routing error, figures for 1992 are not available, hose in inactivity between 1984 and 1991 were initially classified as 'LF unemployed' (the definition then in use) and therefore lassified by reason. They have been included in the 'other' category and hence there are discontinuities between 1991 and me of the proportions, notably for the 'other' category.

Other

per cent of this group for men and 66 per cent for women. The main differences by sex tend to be related to famiresponsibilities. Among women aged 25-34, 72 per cent were inactive as a result of family/home responsibilities pared with only 11 per cent of men of the same age. Around 60 per cent of active women aged 35-49 also gave this as their reason for inactivity.

Discouraged worker

Another striking aspect of Table 2 is the proportions of men giving their reason for inactivity as being long-term sickness or disability. Among inactive males aged 25 to 34, 43 per cent were long-term sick or disabled. This proportion was higher for the 35-49 age group at 64 per cent than for the 50-64 age group at 55 per cent. This is mainly due to the higher proportion of people

Economic inactivity in the labour market

in the latter age group who were inactive due to early retirement (29 per cent)

Characteristics of those who are economically inactive

It is clear that the inactive groups make up a significant sector of the population but how do the data differ for men and women and by different age groups? The relative stability of the total inactivity rate masks different patterns among men and women. For women, the rate shows a reduction from 35 per cent of those of working age classified as inactive in 1984, to 28 per cent in 2001, but the proportion of men who are inactive has risen from 12 per cent to 16 per cent over the same period.

Over the past 20 years or so there has been an increase in the economic inactivity rates among young people. This reflects the increase in proportions staying on in full-time education. These changes have had quite a substantial impact on the inactivity rate of people aged 18-24. In spring 2001, for example, the economic inactivity rate excluding students was 14 per cent compared with 27 per cent with students included. Men aged 35 to 49 have seen the largest increases in inactivity rates in the past ten years (see Table 3), although in terms of numbers. the 50-64 group is still by far the largest, making up 44 per cent of the total. The patterns are slightly different for women. The largest declines in the proportion inactive have been in the 25-34 age group due to a number of factors including an increase in the age of childbearing and a reduction in the length of time women spend away from work as a result of having children.

Occupation

The LFS also collects information from inactive and unemployed respondents who left employment in the past three years about their previous occupation. Using SOC90 categories, it is possible to compare the distribution of previous occupations for those in inactivity in spring 1992 with those in spring

Economic inactivity in the labour market

Table 7

2000. In 1992, 17 per cent of those in inactivity were previously employed in clerical and other occupations - the largest group – while in 2000 the most common previous occupational group was personal and protective services. In comparison with the total working-age population, a higher proportion of those in inactivity are concentrated in personal and protective services, service occupations, and plant and machine operatives. Conversely, a smaller proportion had worked as managers and administrators and in professional occupations than the total population.

Oualifications

Inactivity rates also vary quite significantly by levels of educational attainment, as Figure 4 shows. More than half of all working age women with no qualification were inactive in spring 2001, and just over a third of men. In contrast, among those whose highest qualification was a GCSE, the proportion inactive dropped to 14 per cent of men and 24 per cent of women. Those people educated to degree level are the least likely to be inactive: only 7 per cent of men and 12 per cent of women were classified as such. The gap between men and women, in terms of their inactivity rates, reduces with

increases in the level of education. This may indicate that although inactivity rates are generally higher for women, mainly due to childbearing and time spent looking after the family/home, this is a less significant reason for inactivity than for those women who are educated to a higher level.

The joint HMT/DWP⁴ paper notes that, while overall inactivity rates have

been relatively stable since the late 1970s, the composition of those who are inactive has changed considerably, Between the late 1970s and mid 1990s inactivity rose among people with low levels of qualifications, people with disabilities or health problems, th over-50s, lone parents and those in certain disadvantaged areas within the

Economic inactivity in the labour market

Nickell,3 HMT/DWP argue that a key economic driving force behind these trends has been a shift in the employment prospects of workers with low skills. The decline in employment rates among those with no qualifications has been particularly reflected in increased inactivity.

Regions

As would be expected, there are a number of regional variations in economic inactivity and unemployment rates. In Tyne and Wear, for example, one in four people aged 45-49 are classified as inactive compared with one in ten of those of the same age in the East and South West of England. Figure 5 indicates that higher rates of inactivity tend to exist in areas with above averunemployment rates. In age vside, where the unemployment vas 8.7 per cent in spring 2001, rate d 28 per cent of those of working arou age were inactive. In comparison, in more buoyant areas like the South East

areas; spring 2001

Inactivity rate

unemployment was around 3 per cent and the inactivity rate was 17 per cent. It is also possible to compare the proportions of those in inactivity who were long-term sick or disabled by region, as well as the proportions of those in inactivity who wanted a job. Looking at these four variables together, it appears that there are a number of regions with above average rates for all four indicators. These regions are Tyne and Wear, the rest of the North East. Merseyside, West Yorkshire, Wales and Strathclyde. In general, these patterns indicate that in areas of greatest labour market hardship a particularly large share of the jobless may have moved into inactivity, and (recorded) sickness in particular. It should, however, be noted that looking at these sorts of patterns on a regional level might well over-simplify the picture. There is evidence to suggest that differences within regions may well be much larger than the differences between regions. Further analysis would have to be car-

ried out to establish whether the patterns identified at the regional level hold for smaller geographical areas.

European comparisons

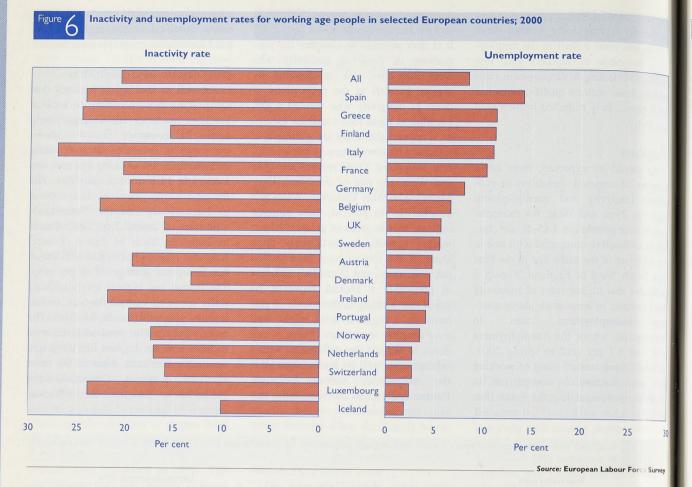

As well as looking at regional patterns, it is also interesting to look at levels of inactivity and unemployment across EU countries. Figure 6 shows the range of levels of unemployment and inactivity for working age men and women in 18 European countries. The lowest unemployment levels are found in Luxembourg and the Netherlands with rates of around 2 per cent, whereas countries such as Spain, France, Italy and Finland have rates well above the European average of 8 per cent. The lowest and highest levels of inactivity seem, to various degrees, to follow the pattern of unemployment. The more southern European countries tend to have both the highest inactivity and unemployment rates whereas the more northern countries (Denmark, the Netherlands, Sweden, the UK and

National Statistics feature

Economic inactivity in the labour market

Economic inactivity in the labour market

Iceland) tend to have both low unemployment and inactivity rates. This general pattern almost exactly reflects employment rates, as would be expected, with southern countries having low employment rates and northern countries having high employment rates.

This may be partly a reflection of differences in the social and political structures across Europe. For example, the highest proportions who are classified as inactive due to personal and family responsibilities, such as childcare, are found in the more southern European countries including Italy, Greece and Spain. The highest rates of inactivity due to illness or disability are found in Denmark, Iceland, Norway and the UK. High levels of retired people in the inactive group are more common in Denmark, Finland, Austria and Germany. Clearly there are a number of complex factors interacting to determine the levels and reasons for inactivity in Europe. Further analysis would

need to be carried out to investigate the impact of these factors on individual subgroups of people across countries. There is also some evidence to suggest that more protective employment legislation has a negative impact on the even distribution of work and efforts to reduce unemployment. For more detail on this see pp445-54, Labour Market Trends, September 2001.

Conclusion

This article is intended as an introduction to a forthcoming series of articles on inactivity. While it is clear that the economically inactive group possess a number of distinct characteristics, the relevance of this group in providing a supply of labour is hard to determine from cross-sectional data. The concept of labour market attachment referred to above is key to understanding how those in inactivity interact with the rest of the labour market. In order to understand this more fully, analyses of the longitudinal LFS databases have been carried out, looking at movements out of inactivity and into other statuses. As mentioned above, this should identify the groups of inactives who are the most mobile and therefore likely to move into activity.

As this article has identified, there are a number of distinct groups of people in inactivity. Further research is planned to look in more detail at a number of these groups, including older men, students and those looking after families and homes including lone parents. These studies will use cross-sectional LFS data as well as longitudinal flows data to help understand the reasons for inactivity for these people and also the dynamics of the groups. In addition, work is underway to look in more detail at the European and international rates of inactivity and to try and explain these differences. The results will be published in future issues of Labour Market Trends.

Revised Labour Force Survey estimates based on more up-todate population data will be released in April 2002 along with the annual seasonal adjustment review. This article describes the methodology used and the anticipated impact of the population revisions.

Introduction

ONS PLANS to release revised Labour Force Survey (LFS) data based on more up-to-date population data in April 2002. The release of these results will coincide with the publication of data revised in line with the annual seasonal adjustment review for the LFS. This article describes the need to move to the new population base, explains the methodology used to produce subnational population data and estimates the anticipated impact on grossing totals at an aggregate level.

The LFS collects information from a sample of the population living in

Technical report

By Allan Smith, Labour Market Division, Office for National Statistics

households. To convert this information to give estimates for the entire household population, the data must be grossed. This is achieved by creating grossing factors, often referred to as weights, which can be applied to each sampled individual so that the grossed results match published National Statistics population data.

A news item in the October 2001 issue of Labour Market Trends drew attention to the plans to regross LFS data - both individual database records and aggregates - for all periods after summer quarter (June to August) 1998.

Technical report

LFS regrossing April 2002

Regrossing is the process of moving from one set of population data, as a basis for grossing the survey, to another. Regrossing will be completed and revised data released in the labour market statistics First Release on 17 April 2002.

The need for regrossing

To understand the need to regross LFS data, it is first necessary to understand the population data which are used in grossing. Four types of official population data exist: the decennial Census of Population; annual mid-year population estimates (MYEs); national population projections (produced every two years); and subnational projections (normally produced every two years for each country of the UK). The MYEs, for a given time period, supersede the existing population projections for that period and each new set of projections supersede previously published projections.

The timetable for publication of population data is broadly as follows: MYEs are published in the August following the period to which they refer (most recently mid-year estimates for mid-2000 were published in August 2001); national population projections are published in the November after this (2000-based projections were published in November 2001); and the subnational projections are published the following year (2000-based subnational projections are therefore yet to be published).

From this, two key points should be noted. Firstly, LFS survey results are available ahead of the timetable for the production of MYEs so that, for example, in August 2001 when the MYEs for 2000 were published, LFS data for April to June 2001 were being published. The LFS therefore uses a combination of estimates and projections for grossing survey results. Secondly, unless new projections and MYEs are adopted by the LFS, grossed survey estimates will no longer reflect the best view of population levels and growth. It is these two factors which necessitate revisions to LFS historic data by regrossing.

At the time the last LFS regrossing was completed (in April 2000) the pop-

ulation data available were 1998 MYEs and 1996-based population projections. While 1998-based national population projections became available as the project was being undertaken, the subnational projections required for the creation of LFS grossing totals had not then been published for each country. These data were subsequently used to produce growth rates for LFS grossing totals. For this project ONS intends to use MYEs for 2000 and 2000-based national projections. As the necessary subnational projections are not yet available, an interim methodology will be used to create subnational data purely for LFS grossing purposes.

Methodology for producing subnational data

As identified above, LFS grossing procedures require subnational population data for the UK dissaggregated by age and sex. However, formal 2000based subnational population projections have not yet been published. To avoid delay to the regrossing project, a methodology has been developed to create the necessary subnational data, consistent with 2000-based national projections.

The approach adopted makes use of all available recent population data. Specifically, the method employs: midyear population estimates for 1998, 1999 and 2000; the 2000-based national projections; and the 1998-based subnational projections. The main strength of the methodology is that it uses all the data to reflect recent trends in fertility, mortality and migration.

The method takes mid-2000 population estimates and applies growth factors for 2000 to 2001 and 2001 to 2002 which are calculated using information from the 1998-based subnational population projections. These are then scaled to allow for relative change between mid-1998 and mid-2000 estimates. Finally, the results are constrained to the 2000-based national projections for constituent countries of the UK. These results are then converted to estimates of the household population by removing the proportion of people living in communal establishments. A more detailed explanation of the method is available on request.

Scale of revisions

As already identified, grossing factors are calculated at a detailed geographic age and sex disaggregation. It is only when this detailed calculation is undertaken that a formal estimate of the impact of the regrossing on LFS estimates can be made. At this stage however, it is possible to give an indication. at the national level, of the estimated difference between the population data being used currently in LFS grossing and those that will be used in the regrossing project. Table 1 demonstrates that for mid-2001 (summer quarter 2001) the new grossing totals for the population aged 16 and over are approx imately 250,000 higher than those currently being used to gross the LFS. For the working-age population, the new grossing totals are approximately 209,000 higher than the current to als.

For indicative purposes, applyin existing employment and unemploy ment rates to these higher population levels would imply an upward revision to employment of approximately 150,000 and an upward revision of approximately 10,000 to ILO memployment for summer quarter 2001. As this approach to estimating the inpact of regrossing takes no account of the difference in age, sex or geographical structure of the new population data relative to that currently being used, the results when published in April 2002 may be considerably different from those quoted above.

Evidence from the last regrossing demonstrated that the impact on published headline rates was quite small with few changes larger than plus or minus 0.1 percentage point on any of the headline rates. It is reasonable to assume that the effect on the rates will be similar on this occasion.

Annual seasonal adjustment review

Each year ONS undertakes a review of the seasonal adjustment of LFS series. This is a large-scale assessment

mid-2003

Published population data and current and estimated LFS population grossing totals;^a United Kingdom; mid-1998 to

A summary of the findings from a survey of lone parents eligible for New Deal for Lone Parents.

Key points

Most lone parents claiming Income Support are women and White. Nearly ported having only one child; and ted they had a child under the age The majority rented their accomon, while significant proportions t have a telephone, a driving licence alifications. Over half had been ng Income Support for two or vears

one in ten lone parents were ng at the time of the survey. Seven were not working at the time, they had in the past. The remaino in ten had never worked; they likely to lack qualifications, live in housing, be women, younger, and had longer spells on Income

out 33 per cent of lone parents not ng at the time of the survey wanted rt work within a year, but 40 per did not expect to start paid work three years. Nearly half of the e expressed an interest in starting a ourse within the next three years.

common barriers to work were childcare, lack of opportunities for work, eptions about employers and pay and levels of skill or confidence. Compared with those not working, many one parents working at the time of the survey cited a similar number of barriers, ndicating that some lone parents manage to work in spite of these difficulties. Nearly two-thirds of lone parents were unwilling to work at the minimum wage.

• A quarter of eligible lone parents expressed interest in one or more of the specific services offered by the New Deal for Lone Parents (NDLP). Those expressing greater interest in the services offered by NDLP tended to be ounger, held better qualifications, and vere interested in starting a job in the next six months to a year.

Introduction

THE NATIONAL Centre for Social Research was commissioned by the Employment Service to carry out a quantitative study as part of the evaluation of the New Deal for Lone Parents (NDLP). NDLP is one element of the Government's Welfare to Work strategy. It is a national voluntary programme aimed at helping lone parents claiming Income Support to improve their living standards, by taking up or increasing hours of paid work, and to increase their job readiness and employment opportunities. The key feature of the programme is a network of Personal Advisers who offer employmentrelated guidance through a series of interviews and contacts with participants.

This report presents findings from the foundation stage of the evaluation. A postal survey was carried out between October 2000 and April 2001 which gathered data about lone parents' demographic characteristics, qualifications, work experience, motivation and barriers to work. The findings bear out many aspects of existing research on lone parents.

Methodology

In the first stage of the project a postal survey was sent to almost 70,000 lone parents on Income Support who were eligible to participate in NDLP. Over 42,000 questionnaires were returned, indicating a response rate of 64.4 per cent. The postal questionnaire was designed to identify key characteristics of the eligible population not available from administrative data.

When selecting the sample for the postal questionnaire, administrative records were checked to establish that individuals selected had not participated in NDLP. Later monitoring identified a subset of lone parents who had participated after returning the questionnaire. The report includes a preliminary comparison of these NDLP participants with non-participants. The next stage of the project will match the participants identified in the postal survey with a control sample of non-participants in order to measure the impact of NDLP.

Research brief

Characteristics of the eligible population

Confirming what is already known from administrative data, most eligible lone parents who returned the postal questionnaire were women, in the middle age ranges, and White. Nearly half had only one child in their care. A similar proportion had a child under the age of five. In addition:

- the majority rented their accommodation, usually from the local authority or housing association;
- a significant proportion did not have a telephone at home, and this was particularly true among social renters;
- the majority lacked a full driving licence;
- half reported no academic or technical qualifications; and
- over half had been on Income Support for two or more years.

These factors suggest that the capacity to find work is low for many lone parents.

Employment experience

Only one in ten lone parents on Income Support were working at the time of the survey. They tended to be women, have qualifications, and be homeowners or have a mortgage. This group had relatively brief spells on Income Support.

The majority of lone parents on benefit nearly three in four - were not working at the time of the survey but had some experience of work. A third wished to start work within a year, but 40 per cent did not anticipate working in the next three years.

Another 18 per cent of the eligible population reported no work experience at all. A lack of qualifications and accommodation in social housing proved to be strongly associated with never having worked. In addition, those who had never worked tended to be: women; lone parents in the younger age bands; those who were younger at the time of their first child's birth; and those who had longer spells on Income Support.

Barriers to work

An array of barriers to work were cited by lone parents on Income Support. Health-

related factors were least commonly cited. though they tended to be more persistent as barriers to work. Barriers more widely cited included those pertaining to childcare, the perceived availability of work, perceptions about employers and pay, and low levels of skill or confidence. It is barriers such as these that NDLP is designed to address.

Many lone parents who were presently working faced a number of barriers, suggesting that lone parents do not necessarily move into work when they cease to face barriers but when they can sustain work in spite of barriers. However, the barriers they cited differed in important ways from lone parents who had never worked. Those presently working were less likely to cite: a lack of confidence or skills; worry about leaving their child with someone else; worry that employers would not hire them due to their childcare responsibilities; and a health condition or disability

Wage expectations may act as an additional barrier to work. Nearly two-thirds of the lone parents queried indicated they would not be willing to work at the minimum wage, although the percentage was lower among those lone parents currently working.

Commitment to work

A set of nine attitudinal statements gauged attitudes toward work. They included such notions as 'A person must have a job to feel a full member of society' and 'If I didn't like a job, I'd pack it in...' Based on a summary analysis of responses to these statements, overall 'commitment to work' was assessed

Commitment to work was especially high among: lone parents who were currently working: those who intend to work in the near future; and Black lone parents.

Those who face multiple barriers and demonstrate low levels of commitment to work are less likely to be selected in the next stage of research, since they are unlikely to be programme participants or closely matched to them on key characteristics. As such, the postal survey data can continue to be exploited for insight into the circumstances of all eligible lone parents.

Interest in study, training and NDLP services

A small minority of eligible lone parents were engaged in study or training at the time of the postal survey. An additional group nearly half of the sample - expressed interest in starting a course within the next three years. Those hoping to start a paid job in the near future were especially interested.

A quarter of eligible lone parents expressed interest in one or more of the specific services offered by NDLP. There was little variation in interest among the services tested. Only 'help in trying out a job' was less popular. Those professing greater interest in the services offered by NDLP tended to be: younger; interested in starting a job in the next six months to a year; and those with academic and/or technical qualifications.

Lack of interest in NDLP services was especially prevalent among older lone parents, those who felt that work was not an option in the next three years, and lone parents who lacked qualifications.

NDLP participants and non-participants

Because some of the postal surv. respondents participated in NDLP after returning their questionnaire a preliminar analysis is available comparing participant to non-participants. There was little variation in programme participation based or age and ethnicity, although participant tended to: have fewer children; have had briefer spells on Income Support; hold som qualifications; and anticipate working in the near future.

The next stage of the survey has involved matching the participants identified in the postal survey with similar non-participants and carrying out face-to-face interviews among each group in October 2001. A com parison of outcomes among participants and non-participants in the New Deal for Lone Parents will be used to judge the programme's effects

National Adult Learning Survey 2001

By Ivana La Valle and Margaret Blake, National Centre for Social Research

This research brief highlights the main findings from the 2001 National Adult Learning Survey.

Doints

Between 1997 and 2001 the proportion of non-learners has gone down from 26 to 24 per cent, in line with the national learning target for adult participation.

ming participation was considerower than average among some including: people aged 70 or over er cent), adults with no qualifica-(25 (31 per cent), those looking after tions mily (52 per cent), people with a the income below £10,400 (53 per fam and those living in the most cent deprived areas (63 per cent).

le negative attitudes to learning influence the behaviour of some earners, many in this group faced more practical obstacles, including: lack of the due to work and family, financial difficalties, lack of knowledge about learning opportunities and concern about their perceived inadequacy (e.g. literacy problems)

• Some 44 per cent of non-learners would like to have done some learning; financial support (25 per cent), advice per cent) and improved job chances per cent) were identified as the main factors that would facilitate their learning.

 Most respondents started learning for job-related reasons and believed that they had benefited from vocational learning in many different ways, from increased competence in one's job to more job satisfaction

• Wider motivators and benefits, such as increased confidence, self-esteem and better social life, were also mentioned by nany and were particularly important for certain groups, such as older people and those not in paid employment.

• Over half (55 per cent) of respondents vere computer users, while 44 per cent vere Internet users. Use of ICT for earning was also very common, with around half of learners saying they had used a computer and/or the Internet for heir learning.

Introduction

THE NATIONAL Adult Education Learning Survey (NALS) series, which explores participation in a wide range of learning activities, was started in 1997. It is used by the Department for Education and Skills (DfES) to evaluate the effectiveness of its adult learning policies. It is also used to monitor progress in meeting the national learning target for adult participation, which aims to reduce the proportion of non-learners found in 1997 by 7 per cent, that is, to reduce this group from 26 to 24 per cent by 2002.

Methodology

NALS 2001 was carried out by the National Centre for Social Research on behalf of the DfES between January and May 2001. The survey achieved a 63 per cent response rate and included 6,459 faceto-face interviews with adults aged 16 or over' in England and Wales. For the first time, in 2001, people aged over 70 were included in the survey. In order to maintain comparability with previous NALS the results for older respondents are usually presented separately.

Learning trends

The survey asked a number of questions about a variety of learning experiences in the previous three years (i.e. since January 1998), or since leaving continuous full-time education, if this was more recent. Learning activities were classified either as taught learning, if they involved some formal teaching (including distance learning), or as self-directed learning, if people taught themselves without receiving any form of tuition.

Between 1997 and 2001 the proportion of respondents classified as non-learners has gone down from 26 to 24 per cent thus meeting the national target set for participation in adult learning.

The overall increase in participation in learning in the past four years (from 74 to 76 per cent) is mainly due to an increase in selfdirected learning (57 to 60 per cent), while participation in taught learning has changed very little (from 58 to 59 per cent).

Research brief

Participation in vocational learning² has also hardly changed (from 67 to 68 per cent).

Analysis of participation in learning using a 12-month reference period shows that 68 per cent of respondents reported some learning in the previous year and only 8 per cent had done some learning since January 1998, but not in the previous 12 months.

The survey also found that the likelihood of participating in future learning was strongly related to involvement in learning in the past. While three-quarters of learners said they were likely to do job-related learning in the next three years, only a third of non-learners were likely to do so. The corresponding figures for future non-vocational learning were 54 per cent for learners and 23 per cent for non-learners.

Learning among different groups

Previous NALS have shown some consistent variations in participation in learning among different groups. Looking at age, the highest learning participation rates (between 80-86 per cent) were found among those aged 20-49, the lowest (25 per cent) among the 70+ group. Since 1997, learning among the under-20s has declined from 82 to 76 per cent, while it has increased from 67 to 74 per cent among those in the 50-59 age group.

Among adults with no qualifications 31 per cent reported some learning, compared with 93-95 per cent of people qualified at NVQ level four or above. Since 1997, participation has increased from 71 to 78 per cent among those qualified at level one.

Looking at people's main activity at the time of the survey, the highest participation rates were found among respondents in paid work (81-89 per cent), followed by the unemployed (68 per cent) and those looking after the family (52 per cent). The lowest participation was among those outside the labour market, that is, the retired (48 per cent) and those unable to work because of a disability (42 per cent). Since 1997 participation in learning has gone up among people looking after a family (from 47 to 52 per cent) and the retired (from 43 to 48 per cent) while it has declined among the unemployed (from 72 to 68 per cent).

Around 91 per cent of respondents with a household income of £31,200 and over reported some learning; the equivalent figure for those in the lowest income bracket (below £10,400) was 53 per cent. A strong association was also found

between learning and local deprivation:3 participation in learning ranges from 85 per cent in the least deprived areas to 63 per cent in the most deprived ones.

Obstacles and incentives to learning

While negative attitudes to learning and perceptions about its relevance might influence the behaviour of some non-learners many in this group faced more practical obstacles including: lack of time due to work (24 per cent), family (30 per cent) and childcare responsibilities (19 per cent); difficulties in paying for course fees (27 per cent) and fear of losing benefits if started a course (9 per cent); lack of knowledge about local learning opportunities (28 per cent) and learning advice sources (15 per cent); and being nervous about going back to the classroom (26 per cent); lack of necessary qualifications to join a course (24 per cent); concern about not being able to keep up with the course (21 per cent); and difficulties with reading and writing (11 per cent), English (7 per cent) and numeracy (6 per cent)

Some 44 per cent of non-learners would like to have done some learning. The most common subjects they would like to have learnt about were: computing (30 per cent), training for professions (20 per cent) and leisure activities (19 per cent). The main factors that would have helped their learning were: funding (25 per cent), advice (19 per cent) and improved job chances (17 per cent).

The motivators and benefits of learning

Work remains an important motivator for learning: 80 per cent of taught courses and 55 per cent of self-directed learning episodes were started to help with a current or future (paid or voluntary) job. Factors associated with the need to maintain and enhance one's employability came very high on the list of reasons for taught and self-directed vocational learning, including: the need to gain skills for the current job (54-55 per cent); to develop one's career (52-57 per cent); and to increase job satisfaction (39-47 per cent).

Learning experiences seem to be meeting people's work expectations, as most respondents believed they had benefited in a variety of ways from vocational learning, from increased competence in one's job (45-48 per cent) and skill acquisition (39-49 per cent) to more job satisfaction (26-31 per cent).

People also engaged in learning for a variety of non-work related reasons including: improvement of skills and knowledge (78-82 per cent); the desire to do something interesting (39-46 per cent); and curiosity about the subject (27-47 per cent).

Learning had a positive impact on many aspects of respondents' lives. Apart from the predictable improvement in skills and knowledge (71-75 per cent) around a third said the learning experience had boosted their confidence, improved their social life (13-33 per cent) and improved their health (10-11 per cent). The wider motivators and benefits of learning seemed particularly important for some groups, such as older people and those not in paid employment.

Use of and attitudes towards ICT

For the first time in 2001, the survey explored the use of information communication and technology (ICT):4 67 per cent of adults had used ICT at some point in their life, while around half were current users (55 per cent were current computer users and 44 per cent were current Internet users).

Looking at ICT use among different groups it was found that: • between 71 and 78 per cent of under-50s

- were ICT users, compared with 29 per cent of those in the 60-69 age group and 10 per cent of older people;
- only 27 per cent of people not in paid employment were ICT users, compared with 78 per cent of employees and 67 per cent of self-employed people;
- a quarter of those in the lowest income group (under £10,400) were ICT users, compared with 86 per cent of those with a family income of £31,200 and over; and
- less than half (45 per cent) of respondents in the most deprived areas were ICT users, compared with 64 per cent in the least deprived areas.

While a third of ICT non-users said they were not interested in using a computer, the majority reported a wide range of obstacles including: lack of knowledge about computers (68 per cent), not having a computer at home (34 per cent), not being very good with computers (28 per cent) and the cost of ICT (27 per cent).

Social capital and learning

For the first time, in 2001, information was collected about respondents' involve-

ment in leisure, voluntary and commun activities to investigate the extent to which these measures of social capital are associated as a social capital are associated as a social capital are associated as a social capital as a social capital are associated as a social capital as a social capital are associated as a sociated as a sociate ated with learning5. Learning among peop who watched high levels of television (mo than two hours a day) was lower than aver age (58 per cent). Even when controlling for factors such as level of education an income those who watched high levels of television were still less likely to have par ticipated in learning. Looking at newspap reading, it was found that respondents w read broadsheets were considerably r likely than others to have done some lear ing (85 per cent) and this relationsh remained even after controlling for socio economic characteristics. People no involved in community and voluntary activ. ities (e.g., helping their neighbours, going to a group or place of worship, tackling local issues) were least likely to have participated in learning (57 per cent), while the more of these activities people were involved in th more likely they were to have participate in learning; for example, 81 per cent of those who reported participating in three or more of these activities had done som learning.

Information, knowled and attitudes about learning

The survey included some questions o advice and information about learning6 and awareness of government initiatives

- the main sources of learning advice were employers (31 per cent), educational institutions (28 per cent), friends and family (19 per cent) and work colleagues (17 per cent).
- the most common advice sought was about courses available (54 per cent), places to do learning (50 per cent) and courses for particular jobs (40 per cent); and
- a third of respondents had heard of 'learndirect',7 a quarter of Career Development Loans and 15 per cent of Individual Learning Accounts. Use o these among respondents was very low although this might reflect the relatively recent introduction of some of these schemes

- The survey excluded adults in continuous full-time education
- Vocational learning was defined as learning, either taught or self-directed, which was started to alo with current or future work, paid or voluntary.
- his analysis was carried out by using the Department for the Environment, Transport and the egions multiple deprivation index, only respondents in England were included.
- The results in this section include respondents of all ages and not only those under 70 as in the revious sections
- The results in this section include all respondents.
- Only learners were asked these questions.
- The survey asked about awareness of the learndirect telephone helpline and website, and not bout the full range of services developed by Ufl Ltd, which also include a network of learning entres and a range of learndirect branded learning materials.

Sources of labour market statistics

MAIN SOURCES

Labour Force Survey

Much of the labour market data published are measured by the LFS. The concepts and definitions used in the LFS are agreed by the International Labour Organization (ILO), an agency of the United Nations. The definitions are used by European Union member countries and members of the Organisation for Economic Co-operation and Development

The LFS is the largest regular household survey in the United Kingdom. In any three month period, a nationally representative sample of approximately 120,000 people aged 16 or over in around 61,000 households are interviewed. The survey also covers students in halls of residence (who are sampled in their parental residences) and people living in NHS accommodation. Each household is interviewed five times, once every three months. The initial interview is generally done face-to-face by an interviewer visiting the address. Further interviews are done by telephone wherever possible. The survey asks a series of questions about respondents' personal circumstances and their labour market activity, with most questions referring to activity in the week before the interview. The first and fifth interviews also ask about earnings. Interviews are carried out continuously throughout the year and key results are published every month for the latest available three month period. Other data are available once a quarter or once or twice a year.

The LFS was carried out every two years from 1973 to 1983. The ILO definition was first used in 1984. This was also the first year in which the survey was conducted on an annual basis with results available for every spring quarter (March to May). The survey moved to a continuous basis in spring 1992 in Great Britain and in winter 1994/5 in Northern Ireland, with results published four times a year. Since April 1998, results are published 12 times a year for an average of each threemonth period. LFS data are published around six weeks after the period to which they refer.

The LFS three-monthly results can be compared in various ways over time, shown by the chart below. The shaded areas show the periods for which LFS results are available. Comparisons over time should be made with the periods shaded in the same patterns, e.g. January to March 2000 should be compared with January to March 1999 or October to December 1999. Comparing estimates for overlapping three-month periods can produce more volatile results which can be difficult to interpret. In order to make three-month on three-month comparisons, it is important to use seasonally adjusted data.

The LFS household datasets are designed specifically to be used for analysis at the household and family level. A technical report in Labour Market Trends of August 1998 describes why and how they have been nroduced

Employer surveys

ONS conducts a range of employer surveys, collecting information on their turnover and profits, and also the number of filled jobs

The Annual Business Inquiry (ABI) is conducted in December to measure the number of employee jobs. The survey samples around 78,000 reporting units of workplaces situated in the United Kingdom. As well as measuring employee jobs, the ABI also collects financial information from the same set of units. Therefore, figures derived from both parts of the survey (e.g. turnover per head) are consistent.

Short-Term Turnover Employer Surveys are smaller surveys which are conducted every three months The surveys are used to provide estimates of quarterly changes in the number of jobs between the annual surveys. For production industries surveys are conducted monthly, allowing estimates to be produced for each month. Around 9,000 production enterprises are sampled each month.

Both the ABI and the Short-term Turnover Employer Surveys take a sample of businesses from the Inter-Departmental Business Register (IDBR). The IDBR holds details of all businesses that run a PAYE tax system or register for VAT.

The Monthly Wages and Salary Survey covers a sample of firms in Great Britain. The survey obtains details of the gross wages and salaries paid to employees, in respect of the last pay week for the weekly paid, and for the calendar month for the monthly paid. The sample covers the wage bill for some 9 million employees. It is used to calculate the Average Earnings Index.

Administrative records

Labour market data on the number of people claiming unemployment-related benefits and Jobcentre vacancies are derived from administrative records

Claimant count data are provided by the Benefits Agency. Jobseeker's Allowance (JSA) replaced both Unemployment Benefit and unemployment-related Income Support on 7 October 1996. Up to 6 October the claimant count figures included those who claimed Unemployment Benefit, Income Support or National Insurance credits. A seasonally adjusted consistent claimant count series is available from 1971. The claimant count records the number of people claiming unemployment-related benefits on one particular day each month. Claimant count figures are announced five weeks after the date to which they refer

Data on vacancies are produced by the Employme Service (ES) as a by-product of its Labour Marke System (LMS). LMS is the computer system that ma ages the currency of vacancies on display, controls the circulation around Jobcentres, and identifies those f liaison action with employers. A consistent vacan series is available from 1985.

EMPLOYMENT

two ways of looking at employment: the

concepts represent different things, as one

have more than one job (see 'Comparison of

1997, pp511-16 for more details of

of employment data', Labour Market Trends,

es between the two sources). People aged 16

are classed as employed by the Labour Force

ES) if they have done at least one hour of

the reference week or are temporarily away

h (e.g. on holiday). People classify themselves

of four categories in the LFS (according to their

if they have more than one): employees, self-

d, unpaid family worker (doing unpaid work for

run business) or participating in a government-

nber of jobs is mainly collected through postal

r surveys (see notes on sources). This gives the

of employee jobs (formerly known as

es in employment). The total number of

ce jobs (formerly known as workforce in

nent) is calculated by summing employee jobs,

oloyment jobs from the LFS, those in HM Forces

ernment-supported trainees. As the main part

estimate is the employee jobs total, this

ation represents the employers' perception of

any jobs there are. It excludes homeworkers and

who, in their main job, work on their own

the total workforce jobs. Includes self-employed

their main job and people who are employees in

ain job who are self-employed in their second job

on government-supported training programmes are

t of employment. If, however, they do not have a

contract of employment they are included in the workforce

in the employee jobs estimate if they have a

nent rates can be presented for any population

as the proportion of that group who are in

nent. The main presentation of employment

ates is the proportion of the population of working age

(16-59 for females and 16-64 for males) who are in

e International Labour Organisation (ILO) definition of

employment covers people who are out of work want a job, have actively sought work in the previous

four weeks and are available to start work within the

Count of claimants of unemployment-

le claimant count records the number of people

offices. People claiming JSA must declare that they are

out of work, capable of, available for and actively

eeking work during the week in which the claim is

made. They enter into a Jobseeker's Agreement setting

out the action they will take to find work and to improve

their prospects of finding employment.

ning unemployment-related benefits. These are

USING DATA SOURCES

Because the different sources of labour market dat have different strengths and limitations, it follows the they are best used for different purposes. This section identifies the source of data that ONS recommer using for different types of analysis of three aspects of the labour market: employment, unemployment, and earnings.

Employment

The LFS provides a more complete measure of amploment than the workforce jobs series, but the workfor jobs series probably provides a more accurate indust al breakdown than the LES

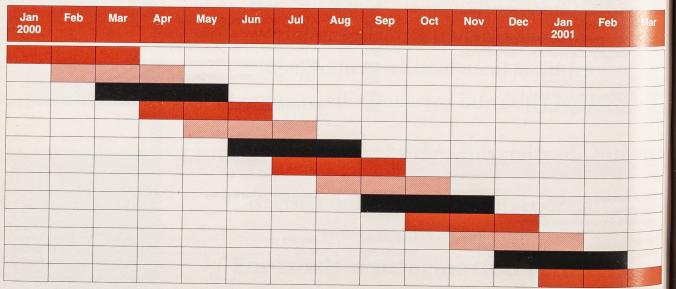

To gain an idea of the extent of work being per formed in the UK, the LFS is preferred. The LFS is also the only source of detailed information about the cha acteristics (occupations, homeworking, work patter and so on) of people's work - except for the industry i which people work, where the workforce jobs series in likely to be more accurate, and consistent with other national economic series.

Unemployment

The LFS provides a more complete measure of unemployment (under the ILO definition) than the claimar count (which measures benefit receipt), especially for women, and is better-suited to international comparisons The claimant count is more useful as a way of assessing unemployment in small areas (below the level of regions); it is also useful as a timely indicator of up to-date changes in unemployment.

Earnings

For monthly estimates of changes, the Average Earnings Index is most suitable. For annual changes, the New Earnings Survey should be used estimates of levels (amounts workers earn each week) each hour), the sources are the NES and LFS. The NES is preferred as a source of the earnings of full-time and ees, and of the hourly earnings of all employees. The LFS is preferred as a source about the earnings of part-time employees. LFS earnings estimates are published in the LFS Quarterly Supplement.

Definitions

The terms used in the tables are defined more fully in the periodic articles in Labour Market Trends that relate to particular statistical series

ILO unemployment rate

The percentage of economically active people who are unemployed on the ILO measure. Can be calculated for any population group.

Claimant count rate

The number of claimants resident in an area expressed as a percentage of the sum of claimants and workforce iobs in the area.

ECONOMIC ACTIVITY

Economically active

The economically active population are those who are either in employment or ILO unemployed.

Economic activity rate

The number of people who are in employment or unemployed as a percentage of the total population aged 16 and over. Can be calculated for any population group.

ECONOMIC INACTIVITY

Economically inactive

Economically inactive people are out of work, but do not satisfy all the criteria for ILO unemployment, such as those in retirement and those who are not actively seeking work.

Economic inactivity rate

The number of economically inactive people as a percentage of the total population aged 16 and over. Can be calculated for any population group.

EARNINGS

Earnings

A measure of gross remuneration people receive in return for work done. It includes salaries and bonuses but does not include non-monetary perks such as benefits in kind. This differs from income, which is the amount of money received from all sources. Income includes interest from building society and bank accounts, dividends from

CONVENTIONS

The following standard symbols are used:

- not available nil or negligible (less than half the
- final digit shown) provisional
- break in series
- R revised
- series revised from indicated entry onwards
- nec not elsewhere classified
- SIC UK Standard Industrial Classification
- EU European Union

Where figures have been rounded to the final digit. there may be an apparent slight discrepancy between the sum of the constituent items and the total as shown. Although figures may be given in unrounded form to facilitate the calculation of percentage changes, rates of change etc by users. this does not imply that the figures can be estimated to this degree of precision, and it must be recognised that they may be the subject of sampling and other errors.

shares, benefit receipts, trust funds, etc. It should be noted that the Average Earnings Index excludes bonuses at the more detailed industry levels shown in Table E.2, in order to reduce volatility in the Index.

Average Earnings Index

Average earnings are obtained by dividing the total paid by the total number of employees paid, including those on strike. The headline rate is the change in the average seasonally-adjusted index values for the last three months compared with the same period a year ago, and replaces the underlying rate of change.

HOURS WORKED (New Earnings Survey)

Normal weekly hours

The time which an employee is expected to work in a normal week excluding all overtime and main meal breaks.

Weekly hours worked

The actual hours worked during the reference week and hours not worked but paid for under guarantee agreements

HOURS WORKED (Labour Force Survey)

Respondents to the LFS are asked a series of questions

enabling the identification of both their usual hours and their actual hours during the reference week, excluding meal breaks, but including paid and unpaid overtime

OTHER DEFINITIONS

General index of retail prices

The Retail Prices Index measures the change in the prices of goods and services bought for the purpose of consumption by the vast majority of households in the UK. The general index includes virtually all types of household spending as detailed in Table H.12.

Labour disputes

Statistics cover disputes (strikes) connected with terms and conditions of employment. Workers involved and working days lost relate to persons both directly and indirectly involved at the establishments where the disputes occurred.

Productivity

The number of units of output (measured by the Index of Production for the manufacturing sector and by Gross Domestic Product for the whole economy produced by each filled job.

Standard Industrial Classification (SIC)

The classification system used to provide a consistent industrial breakdown for UK official statistics. It was revised in 1968, 1980 and 1992. The SIC 1992 classification splits businesses into 17 sections, A-Q. The breakdown includes the following categories: production industries - SIC 1992 Section E including manufacturing (Section D): service industries - SIC 1992 Sections G-Q.

Standard Occupational Classification (SOC)

The classification system used to provide a consistent occupational breakdown for UK official statistics. This system was introduced in 1991. The revised classification (SOC2000) replaced SOC90 in the LFS from spring 2001.

Unit wage costs

A measure of the cost of wages and salaries in producing a unit of output.

Jobcentre vacancies

A job opportunity notified by an employer to a Jobcentre or careers office (including 'self-employed' opportunities created by employers) which remained unfilled on the day of the count.

LABOUR MARKET SUMMARY Labour Force Survey summary - technical note

COMPARISONS OVER TIME

ONS recommends that non-overlapping periods are always used for comparisons over time.

The sample design of the LFS enables estimates for any three consecutive months to be calculated. ONS began publication of these estimates April 1998. The most reliable comparison is one between non-overlapping periods. For the latest data, compare the data from three months previous e.g. December to February data with that for September to November rather than November to January. Due to the overlap of two months, the latest data are an end of the section of the s comparison would actually just compare the single months of November and February, but the data are not robust enough to make this comparison This can lead to unreliable conclusions about change. For further details see article by Richard Laux, pp59-63, Labour Market Trends, February 199

SAMPLING VARIABILITY OF LABOUR FORCE SURVEY DATA

SAMPLING VARIABILITY OF LABOUR FORCE SURVEY DATA LFS data are based on statistical samples (see Sources, pS2) and, as such, are subject to sampling variability. If we drew many samples, each would give a different result. The ranges shown for the LFS data in the table below represent '95 per cent confidence intervals'. We would expect that in 95 per cent of samples the range would contain the true value. The ranges are approximated from not seasonally adjusted data for Sep-Nov 2001 in line with research on the topic. For more information, see the *Guide to Labour Market Statistics Releases*, or the LFS Quarterly Supplement.

UNITED KINGDOM SEASONALLY ADJUSTED	Level	Sampling variability	Change on quarter	Sampling variability	Change on year	Sampling variability
In employment (000s)	28,227	±161	65	±117	252	±207
Employment rate	74.6%	±0.3%	0.0%	±0.3%	0.1%	±0.5%
LO unemployment (000s)	1,522	<u>+</u> 52	15	±54	-55	±71
LO unemployment rate	5.1%	±0.2%	0.0%	±0.2%	-0.2%	<u>+</u> 0.2%
Economically active (000s)	29,748	±158	80	±115	197	<u>+</u> 204
Economic activity rate	78.8%	<u>+</u> 0.3%	0.1%	<u>+0.2%</u>	-0.1%	<u>+</u> 0.4%

For more detailed analyses, please see the Labour Force Survey Quarterly Supplement.

Note: Following the introduction of the Local Labour Force Survey (see article pp195-9, Labour Market Trends, May 2000), the survey design main Labour Force Survey has changed from June 2000. There will be more interview areas from which interviews will be selected. In the sho (i.e. from April to June 2000 until August to October 2001) it is predicted that there will be a very slight increase in standard errors across me of employment, ILO unemployment and economic inactivity (expected to be no bigger than 4 per cent), as the survey methodology switche old to new interview areas. After that period there will be a decrease in those standard errors because of the increase in the number of interview leading to improved stratification of the sampling. There will be no impact on the levels, rates or changes in LFS data; there will only be an impact at standard errors. For more information see article by Dave Elliot in the July 2000 edition of the ONS Survey Methodology Bulletin, or contact drive Jones, tel. 020 7533 6133.

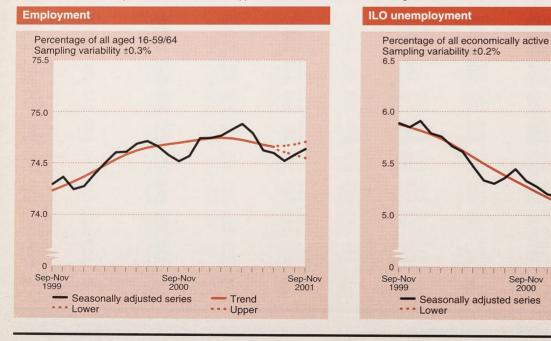

LABOUR MARKET SUMMARY .2 Labour Force Survey trends series: employment and unemployment - technical note

Trends indicating the underlying movement of the series, after factors such as seasonality and irregular values have been removed, are sh the graphs below. The trends are estimated using a standard approach adopted by ONS, based on the results of its short-term trends research participation of the seasonally adjusted series. For more information, see *An Investigation of Trend Estimation Methods*, available from the Time RIMA Analysis Branch (020 7533 6236).

Estimates of the trends at the end of the series are subject to revision when new data become available. The graphs below give an indication of the likely extent of these revisions. They have been constructed by making statistical estimates of the range of values within which the next data by in the series is likely to fall. The resultant extended series have been used to calculate the corresponding likely range of revised trend estimates. N that this range does not take account of revisions which might arise from seasonal adjustment

There is a margin of error surrounding the trend estimates, particularly at the end of the series. The trend can be used to get a general impossion of the underlying trend behaviour of employment, or ILO unemployment, but month-on-month changes in the trend numbers should not be recorded

For further information, please see the article on pp431-6, Labour Market Trends, August 1999.

d estimates prior to Dec 94-Feb 95 (excluding Mar-May periods), are based on data including interpolated data for Northern Ireland. For further information see pp211-15, Labour ket Trends, April 1999

Levels are for those aged 16 and over and rates are for those of working age. Levels and rates are for those aged 16 and over. The rate is as a proportion of the economically active.

There is a margin of error surrounding the trend estimates, particularly at the end of the series. The trend can be used to get a general impression of the underlying behaviour of employment, or ILO unemployment, but month-on-month changes in the trend numbers should not be reported. For more information, see technical note on pS12.

Sources: Employer surveys; DfES Training Data System; Benefits Agency administrative system; Employment Service administrative system; Monthly Wages and Salaries Survey

Labour Market Statistics Helpline: 020 7533 6094

Count of claimants of unemployment-related benefits, i.e. Jobseeker's Allowance and/or National Insurance credits. National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employed, HM Forces and participants on work-related government training programmes) at mid-2000 for 2000 and 2001 figures and at the corresponding mid-year estimates for earlier years. Months where there are five weeks between count dates. All the rest are four-week periods. The headline rate is the annual change in the average seasonally adjusted series over the latest three months compared with the same period a year ago. Publication of the Jobcentre vacancy statistics has been deferred. Figures from May 2001 are affected by the introduction of Employer Direct. This major change involves transferring the vacancy tak-ing process from local Jobcentres to regional customer service centres, as part of the Modernising the Employment Service Programme. ONS and the Employment Service will continue to monitor and review the data with the aim of publishing the series fairly soon - as soon as it is possible to produce a consistent measure.

Duschold is defined as a single person, or a group of people living at the same address who have the address as their only main residence and either share one main meal a day or share the living commodation (or both). A working-age household is a household that includes at least one person of working age, that is, a woman aged between 16 and 59 or a man aged between 16 and 64. Contages refer to proportion of total working-age households. Cricless household is that least one person of working age where no one is in employment. Contages refer to proportion of total working-age pouseholds with dependent children. Contages refer to proportion of total working-age people living in working-age households. Circlers to all children under 16. Contages refer to proportion of total children living in working-age households.

gures have been adjusted to include estimates for households with unknown economic activity. An investigation was made into the effect that the treatment of households with unknown economic activity on the estimates, particularly of workless households. This showed that the characteristics of 'unknown' households were similar to those of 'known' households within each household type category. adjustment method involves taking each main household type in turn and distributing 'unknown' households across all the economic activity categories. This methodology has also been applied to other schold economic activity states. See the January 2000 issue of *Labour Market Trends* for more details.

lationship between columns: 2=4+5=6+12; 6=8+10; 12=14+16. Denominator = all persons of working age. Denominator = total economically active. Quarter to quarter changes at regional level are particularly subject to sampling variablility and should be interpreted in the context of changes over several quarters rather than in isolation.

Note: The Labour Force Survey is a survey of the population in private households, student halls of residence and NHS accommodation.

The vacancy data for Northern Ireland have been suspended since March 1999. National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employed, HM armed forces and government-supported trainees) at mid-1999 for 1999 and 2000 figures and at the corresponding mid-year estimates for earlier years.

TECHNICAL NOTE: LABOUR FORCE SURVEY SAMPLING VARIABILITY - September to November 2001

LABOUR MARKET SUMMARY A.11 Regional summary

Labour Market Statistics Helpline: 020 7533 6094

- The Labour Force Survey data in table A.11 are based on statistical samples and, as such, are subject to sampling variability. If many samples were drawn, each would give a different result. The ranges shown for the LFS data in this table The ranges shown for the LFS data in this table represent '95 per cent confidence intervals'. It is expected that in 95 per cent of samples the range would contain the true value. The ranges are approximated from non-seasonally adjusted data in line with research on the topic. For more information, see the *Guide to Labour Market Statistics Releases*. Following the introduction of the Local Labour Force Survey, the survey design for the main Labour Force Survey has changed, from June 2000, temporarily increasing standard errors.
- 2000, temporarily increasing standard errors. See technical note, pS12.

Includes people who did not state their occupation.

Note: These data use the revised Standard Occupational Classification (SOC 2000). Estimates prior to Spring 2001 are not available currently. For further information see pp357-364, Labour Market Trends, July 2001. General information on SOC 2000 can be found on the National Statistics website at www.statistics.gov.uk/nsbase/methods_quality/ns_sec/soc2000.asp.

Division between manual and non-manual is no longer available.

Customer helpline: 01633812318 Estimates of part-time employees in the United Kingdom are only available on a quarterly basis since December 1992. The Northern Ireland component is not seasonally adjusted. Estimates of self-employment jobs are based on the results of the Labour Force Survey. HM Forces and government-supported trainees. HM Forces figures, provided by the Ministry of Defence, are not subject to seasonal adjustment. Includes all participants on government training and employment programmes who are receiving some work experience on their placement but who do not have a contract of employment (those with a contract employee jobs, self-employment jobs, HM Forces and government-supported trainees.

Revised

* Definitions of terms used will be found on pS3. Workforce jobs figures have been benchmarked to reflect the results from the Annual Business Inquiry for December 2000 and revised results for 1999. Data have been revised from March 1999.

Need more of an insight into labour market data? The Labour Force Survey User Guide provides guidance on the background and methodology of the LFS. It also contains guidance on current and past variables, the LFS questionnaire, LFS classifications and local area data.

The Labour Force Survey User Guide consists of ten volumes to suit varied needs:

- 1) Background and methodology
- 2) LFS Questionnaire
- 3) Details of LFS variables
- 5) LFS Classifications
- 6) LFS Local Area Data
- 7) LFS Variables 1984-91
- 8) Household and Family Data
- 9) Eurostat and Eurostat Derived Variables 10) Regrossing.

Volumes 1,2,5,6,7,8,9 and 10 cost £5 each Volumes 3 and 4 cost £10 each. Complete user guide is £55.

4) LFS Standard Derived Variables

The figures above are calculated by summing employee jobs and self-employment jobs (including self-employed as second job). Estimates of self-employment jobs are based on the results of the Labour Force Survey. Employee jobs data have been revised due to the introduction of the Annual Business Inquiry. Revised estimates for tourism-related industries are not available prior to 1996. b

Output per filled job is the ratio of gross value added at basic prices and productivity jobs. Output per hour is the ratio of gross value added at basic prices and productivity hours.

The full productivity and unit wage costs data sets with associated articles can be found on the National Statistics website at www.statistics.gov.uk/productivity. Data in this table have been revised due to the incorporation of the latest ABI benchmark for 2000 and revisions to the 1999 benchmark.

If you need to keep tabs on the changing world of the labour market, Nomis is the service that can help you. Established in 1986 and run on behalf of National Statistics by Durham University, Nomis is the most comprehensive source of official labour market statistics available on-line including data for a wide range of geographical areas.

Covering such aspects of the labour market as employment, unemployment, jobcentre vacancies, the Labour Force Survey as well as more general population characteristics from the Office for National Statistics, Employment Service, Department of Trade and Industry, General Register Office for Scotland, National Assembly for Wales and Northern Ireland Department of Enterprise, Trade & Investment, Nomis also provides comprehensive analytical facilities enabling you to explore and manipulate time series data and carry out cross-sectional analyses as well as providing user support and training.

a The quarterly time series and annual sex breakdown of the civilian labour force and civilian employment are taken from the LFS and count all people living in private households. Civilian employment percentages by sector are calculated from workforce jobs data on the number of jobs, excluding HM Forces. Industry refers to production and construction industries. Government-supported trainees are allocated to the services sector. Annual civilian labour force and civilian employment refer to spring. Annual civilian employment by sector refers to June.
b Ail persons aged 16 years and over in the United Kingdom and United States; 15 years and over in Australia, Austria, Canada, France, Germany, Italy, Japan, and Switzerland; 15-74 years in Norway; 14 years and over in Spain; 14 years and over in a sector 1998 in Portugal.
c Annual figures for United Kingdom refer to 2001; Belgium to 1998; and Netherlands to 1999.
d Quarterly figures for Australia relate to February, May, August and November; for Austria to March, June, September and December; for France to end-March, June, September and December; for Italy to Jenuary, April, July and October; for Portugal up to 1997 to February, May, August and November and from 1998 to calendar quarters.
e Figures include apprentices in professional training in Belgium and France; permanent military personnel in Switzerland; certain categories of permanent military personnel in Switzerland; certain categories of permanent military personnel in Switzerland; services are included in industry and excluded from services in Greece.
g Annual figures for Greece refer to Q2; for Ireland to April.
h Quarterly data for the US from 1997 Q1, and for Norway from 1999 Q2, are not comparable with data for previous periods.

R Revised

ONS, OECD Labour Force Statistics 1980-2000 and Quarterly Labour Force Statistics. For details of definitions and national sources the reader is referred to the above publications. Differences may exist between countries in general concepts, classification and methods of compilation, so comparisons must be approached with caution.

Denominators are all persons in employment in relevant occupation plus ILO unemployed who last worked in relevant occupation. Includes those who did not state their current or previous occupation. a b

Note: These data use the revised Standard Occupational Classification (SOC 2000). Estimates prior to Spring 2001 are not available currently. For further information see pp357-364, Labour Market Trends, July 20 General information on SOC 2000 can be found on the National Statistics website at www.statistics.gov.uk/nsbase/methods_quality/ns_sec/soc2000.asp. Division between manual and non-manual is no longer available.

* Sample size too small for a reliable estimate.

The seasonally adjusted series takes account of past discontinuities to be consistent with the current coverage of the count (see *Employment Gazette*, December 1990, p608 for the hill ist of discontinuities taken into account, and p516 of the April 1994 issue). It also takes into account the effect of the change in benefit eligibility rules introduced with Jobseeker's Allov (see *Labour Market Trends*, May 2000 pp219-24). To maintain a consistent assessment, the seasonally adjusted series relates only to Calimants aged 18 and over.

National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employes, here and a the corresponding mid-year estimates for earlier years.

st national and regional seasonally adjusted claimant count figures are provisional and subject to revision, mainly in the following month.

Note: The introduction of Joint Claims for Jobseeker's Allowance, on 19 March 2001, has had an upward effect on the claimant count. Since April 2001 ONS estimates that the total impact on the count which accur between April and August, has been some 6,500 for the UK overall (approximately 2,200 men and 4,300 women). The introduction of Joint Claims means that both members of certain couples are now required to claim JSA jointly and both are required to look for work. This applies to couples without dependent child where at least one member was born after 19 March 1976 and is aged over 18. The claimant count continues to include all individual claimants, so there are some extra claimants included as a result of the transmission of transmission of the transmission of transmission of transmission of the transmission of tran

These figures therefore differ in total from those given in Table C.11. The latter include clerically processed claims which currently amount to less than 1 per cent of the total claimant count.

An occasional supplementary analysis by age and duration of the full claimant count including 6,000 clerical claims for April 2001 is available. For further details see pp365-9, Labour Market Trends, July 2001. This is also available on the National Statistics website www.statistics.gov.uk.

Includes some people aged under 18. These figures have been affected by the change in benefit regulations for under 18-year-olds introduced in September 1988.

27,516 9,669 6,512 3,941 3,171 *14.0*

50,809

Note: Only computerised claims are analysed by age and duration on a monthly basis. These figures therefore differ in total from those given in Table C.11. The latter include clerically processed claims which currently amount to less than 1 per cent of the total claimant count.

Per cent employee jobs and claimants

Per cent workforce jobs and claimants

ancashire

Source: Benefits Agency administrative system Labour Market Statistics Helpline: 02075336094

Claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employment jobs, HM armed forces and government supported trainees) and as a percentage of the narrow-based estimate (claimants plus employee jobs). All the rates shown are calculated using mid-2000 based denominators.

a Claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employment jobs, HM armed forces and government-supported trainees) and as a percentage of the narrow-based estimate (claimants plus employee jobs). All the rates shown are calculated using mid-2000 based denominators.
 b The rates for Birmingham Northfield have been revised back to April 2001. The revised series is available from the Labour Market Statistics Helpline, tel. 020 7533 6094. Please note, however, that the denominator for this constituency has not been updated for 1999 onwards due to concerns about the data. ONS is investigating this and will revise the figures at a later date.

alysis has been obtained from the claimant count cohort, a 5 per cent sample of computerised claims. Is in this table started between 12 July and 11 October 2001 inclusive. Us claims in this table started after 11 July 1991. dest 95 per cent confidence interval for the regional percentages is±2.1 percentage points (Wales). dest 95 per cent confidence interval for the male/female percentages is±1.6 percentage points. As have been grossed by a factor of 20 to represent the population.

ILO unemployment as a percentage of the labour force. The standardised ILO rates shown are sourced from ONS (for the UK) and the OECD (for all other countries) and are the most suitable rates for making international comparisons. The rates for all countries apart from Switzerland are based on Labour Force Survey data. For Switzerland, the rates are based on registered unemployment. Levels of other complementary measures of unemployment calimation out for UK, registered unemployed for Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Luxembourg, Norway, Portugal, Spain, Sweden, and Switzerland; LF Stor Austrial, Canada, Itay, Japan and the USA; and a combination of LFS and registered unemployed for the Netherlands. The rate of other complementary measures of unemployment excludes: the armed forces for Austrial, Canada, Ray, Japan and the USA; and a combination of LFS and registered unemployed for the Netherlands. The rate of other complementary measures of unemployment excludes: the armed forces for Austrial, Canada, Germany, and the USA; conscripts for Finland, Italy; those aged 65 and over in Ireland; and the self-employed for Austria. The rate of other complementary measures of unemployment for France and Ireland is derived from the LFS and from registered unemployed. The seasonally adjusted rate of other complementary measures of unemployment refers to October for Netherlands and Novemberfor Germany. For Belgium, both the unadjusted and seasonally adjusted rates refer to October and for Italy to July.

Earnings Survey 2000 or 2000 Streamlined analyses: description

Order from NS Direct T: 01633 812078 F: 01633 812762 The New Earnings Survey, from National Statistics, provides the most detailed and comprehensive information available on the nation's earnings. Our data are presented in seven volumes, each one providing information on a different aspect of Britain's workforce.

Now available/just published

Part A: Summary and description of the survey with streamlined analyses Part B: Analyses of earnings and hours for particular wage negotiation groups Part C: Analyses of earnings and hours for particular industries

occupations

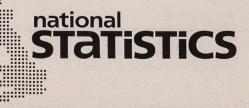

Part E: Analyses of earnings and hours by region, county and small areas

Part F: Analyses for part-time employees; analyses by age group; distribution of hours and earnings by hours **UK Volume:** Streamlined analysis; description of the survey (includes Northern Ireland)

ISBNs

Part A 1 85774 395 4 Part B 1 85774 396 2 Part C 1 85774 397 0 Part D 1 85774 398 9 Part E 1 85774 399 7 Part F 1 85774 400 4 UK Volume 1 85774 401 2

Part D: Analyses of earnings and hours for particular

The headline rate is the change in the average seasonally adjusted index values for the last three months compared with the same period a year ago. For further details please see the article in the May 1999 issue of *Labour Market Trends*, p227.

For further information on the new series, private sector services, please see the article in the May 2000 edition of Labour Market Trends, pp 201-3.

As a result of a change in the survey questionnaire the series excluding bonuses are subject to a discontinuity between January and February 1999. See article on pp267-8 of the May 1999 issue of Labour Market Trends for further details. The average of the latest three months. As a result of a discontinuity in the reporting of data for the agricultural sector, this series is not available before August 1999. Therefore there is no index for this series based on March 1996 as with the other series. Excluding sea transport. The index for the sector education, health and social work is based on a sample which excludes representatives of the private health and social work sector until June 1998. Monthly movements in Excluding private domestic and personal services.

de

Note: The data contained in this table are not comparable with those previously published in Table E.3. Excluding bonuses and averaging the data over a three-month period render the data fundamentally different to the previous indices which included bonuses and related to single months only.

As a result of a change in the survey questionnaire the series excluding bonuses, and thus the bonus effects series, are subject to a discontinuity between January and February 1999. See pp267-8, Labour Market Trends, May 1999 for further details.

For further information on the new series, private sector services, please see the article on pp201-203, Labour Market Trends, May 2000.

a Wages and salaries on a weekly basis (all employees b Seasonally adjusted. C Hourly rates. d Hourly earnings.	5).
--------------------------------------------------------------------------------------------------------------------------	-----

Provisional

Hourly rates: wage earners. All activities excluding agriculture and non-

g Average gross hourly earnings paid to manual workers.

Manufacturing estimates are based on the seasonally adjusted monthly index of average earnings, manufacturing productivity jobs and the manufacturing index of production. Whole economy estimates are based on gross value added at basic prices, total wages and salaries, and productivity jobs. Note:

Source: Employment, Earnings and Productivity Division, ONS Customer Helpline: 01633 812766

The full productivity and unit wage costs data sets with associated articles can be found on the National Statistics website at www.statistics.gov.uk/productivity.

Data in this table have been revised due to the incorporation of the latest ABI benchmark for 2000 and revisions to the 1999 benchmark.

Formerly known as Modern Apprenticeships; launched as an initiative in September 1994 and was fully operational from September 1995. Formerly known as Motional Traineeships; introduced nationally in September 1997. FMA follow-up survey results from November 1999 leavers onwards. Preparatory learning was included in OT from 26 March 2001. Figures for this category are included in the OT figures. LSs introduced in England in September 1999. 25 March 2001 figures in this table are from TEC Management Information. There is a discontinuity in the series because data now comes from the Individualised Learner Record. The numbers of young pec-in training on 25 March 2001 according to this new data source are 116,400 AMAS, 85,400 FMAs, 40,200 OT and 6,600 LSs. Under the new system, training providers have a greater incentive to supply tim information about young people leaving training.

Training For Work (TFW) superseded Employment Training (ET) and Employment Action in April 1993. The figures in this table for leavers from April 1993 onwards include all those who joined Employment Action before 29 March 1993, and left after that date. This will have the effect of reducing the proportions going into a job, full-time education or other government-supported training. "In a positive outcome" includes those in a job, full-time education or other government-supported training.

Leavers to December 1990 surveyed three months after leaving. Leavers from January 1991 surveyed six months after leaving.

e: From April 1995 the definition of leavers changed slightly - see Technical Note to Statistical Bulletin No. 4.97 for details (copies available from Tracy Unwin, DfES, tel no.01142594699).

Formerly known as Modern Apprenticeships; launched as an initiative in September 1994 and was fully operational from September 1995. Formerly known as National Traineeships; introduced nationally in September 1997. FMA follow-up survey results from Nov 1999 leavers onwards. From April 1995 the definition of Youth Training leavers changed, no longer counting those making planned transfers from one training provider to another. Many of these transferring learners without have gained a qualification. Therefore the change in definition will increase slightly the proportions gaining qualifications. Information on levels of qualifications is not available for 1990-91 leavers.

d

Note: From April 1995 the definition of leavers changed slightly - see Technical Note to Statistical Bulletin No. 4.97 for details (copies available from Tracy Unwin, DfES, tel no 0114 259 4699).

Those who responded "No" to the question, "Did you leave your last training programme before you were due to finish?" In a positive outcome = in a job, full-time education or other government -supported training. From April 1995 the definition of Youth Training leavers changed, no longer counting those making planned transfers from one training provider to another. Many of these transferring learners will not have gained a qualification. Therefore the change in definition will increase slightly the proportions gaining qualifications.

er From April 1995 the definition of leavers changed slightly - see Technical Note to Statistical Bulletin No. 4.97 for details (copies available from Tracy Unwin, DfES, tel no 0114 259 4699).

Other training: outcomes for completers

Figures refer to the last Friday of each quarter/month. Those identified by ES as having joined New Deal, including those who have received an initial invitation, but not yet attended their first interview. Those who have left during Gateway either to go into an unsubsidised job or for some other reason, plus those who have left an option without returning to ES. Totals include those whose sex is not recorded. For this reason, and also because of rounding, components will not necessarily sum to totals. Data for Northern Ireland, and hence UK, for January 2000 to October 2001 are not available.

Note: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Data for Northern Ireland, and hence UK, for October 2001 are not available. Including those awaiting their first Gateway interview. Individuals join the Follow-Through stage only after completing their New Deal option. Totals include those for whom sex is not recorded. For this reason, and also because of rounding, components will not necessarily sum to totals. Those recorded by ES as having a physical or mental impairment that has a substantial and long-term effect on their ability to carry out normal day-to-day activities. Excluding those who, when asked their ethnic origin, were recorded as 'prefer not to say'.

Note: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Includes those leaving before receipt of a first interview. Those who are recorded by ES as having been placed into unsubsidised employment, plus those who are recorded as having terminated their Jobseeker's Allowance (JSA) claim in order to go into a job. This will undercount the total number going into a job: some who go into a job will not, for whatever reason, record this as the reason for termination of their JSA claim. These will be counted as not known. Evidence suggests that a significant proportion of those recorded as destination not known who are later contacted in follow-up surveys find work. Where there is no leaving code recorded on JUVOS, or where the leaving code is recorded as 'not known', or simply 'ceased claiming' or 'failed to attend'.

For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Tho

The table counts the number of individuals into employment from New Deal. On this basis, a New Deal participant is only ever counted once as starting employment. If a participant is only ever counted once as starting employment after having had a sustained spell of subsidised employment, then the unsubsidised employment after having had a sustained spell of subsidised employment, then the unsubsidised employment after having had a sustained spell of subsidised employment, then the unsubsidised employment after having had a sustained spell of subsidised employment, the new systems priority. A job from which the participant does not return to claim benefit, or transfer to another option, within 13 weeks. This includes those who have been in employment for less these who have been on sustained employment, this comprises those employed for less than 13 weeks. Excluding those who have been, or are in, sustained unsubsidised employment. Excluding those who have been or unsubsidised employment for less than 13 weeks. Totals include those whose sex is not recorded. Excluding those who who see sex is not recorded.

ng those who, when asked their ethnic origin, were recorded as 'prefer not to say'.

Note: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Figures refer to the last Friday of each year/quarter/month. Those identified by ES as having joined New Deal, including those who have received an initial invitation, but not yet attended their first interview. Those who have completed the Advisory Interview Process and not taken up an opportunity, plus those who have started unsubsidised employment or left JSA for reasons other than starting Employer Subsidy or other provision. Subsequent data may be revised upwards as leavers from WBTATIV and current ES provision are monitored. Totals include those whose sex is not recorded. For this reason, and also because of rounding, components will not necessarily sum to totals.

d Note: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Including those awaiting their first advisory interview. While on the advisory process, clients may participate in provision such as Programme Centres, Jobclub, Jobplan or Worktrials. In Scotland, Training for Work is the equivalent programme. Individuals join the follow-through stage on returning from the employer subsidy, unsubsidised employment, or WBTA/TfW within three months of completing training/leaving JSA; plus those completing education and training opportunities. Totals include those whose sex is not recorded. For this reason, and also because of rounding, components will not necessarily sum to totals. Excluding those who, when asked their ethnic origin, were recorded as 'prefer not to say'. Those recorded by ES as having a physical or mental impairment which has a substantial long-term effect on their ability to carry out normal day-to-day activities.

Note: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Includes those leaving before receipt of a first interview. Where there is no leaving code recorded on JUVOS, or where the leaving code is recorded as 'not known', or simply 'ceased claiming' or 'failed to attend'. As more data are added, the end of the advisory process, clients may return to normal jobseeker activity including regular fortnightly reviews. Those who are recorded by ES as having been placed into unsubsidised employment, plus those who are recorded as having terminated their JSA claim in order to go into a job. This will undercount the total number going into a job: some who go into a job will not, for whatever reason, record this as the reason for termination of their JSA claim. These will be counted as 'not known'.

Includes, for example, gone abroad.

e: For further information, please see article on pp197-206, Labour Market Trends, April 1999.

Labour Market Statistics Helpline: 020 7533 603

Thousa

Thousands

Excluding vacancies on government programmes (except vacancies on Enterprise Ulster and Action for Community Employment (ACE) which are included in the figures for Northern Ireland). Note: For further information, please see the article 'Jobcentre vacancy statistics' on pp159-162, Labour Market Trends, March 2001.

Publication of Jobcentre vacancies statistics has been deferred due to distortions to the data. This table contains vacancy data only up to April 2001. See notes to Table G.3.

Vacancies notified to and placings made by Jobcentres do not represent the total number of vacancies/engagements in the economy. Latest estimates suggest that about a third of all vacancies nationally notified to Jobcentres; and about a quarter of all engagements are made through Jobcentres. Inflow, outflow and placings figures are collected for four or five-week periods between count dates; the figure in this table are converted to a standard 41/3 week month.

The vacancy data for Northern Ireland have been suspended since March 1999 and the figures between March and April 1999 and between September and October 1999 for Great Britain have been affect by corrections by the Employment Service to the recorded stock of unfilled vacancies. There has also been a minor change in the definition of notified vacancies between April and May 2000. See note Table G.3.

Excluding vacancies on government programmes (except vacancies on Enterprise Ulster and Action for Community Employment (ACE) which are included in the figures for Northern а

Note: For further information, please see the article 'Jobcentre vacancy statistics' on pp159-162, Labour Market Trends, March 2001

Publication of Jobcentre vacancies statistics has been deferred due to distortions to the data. This table contains vacancy data only up to April 2001. See notes to Table G.3.

The vacancy data for Northern Ireland have been suspended since March 1999 and the figures between March and April 1999 and between September and October 1999 for Great Britain have been affected by corrections by the Employment Service to the recorded stock of unfilled vacancies. There has also been a minor change in the definition of notified vacancies between April and May 2000. See notes to Table G.3.

Excluding vacancies on government programmes (except vacancies on Enterprise Ulster and Action for Community Employment (ACE) which are included in the figures for Northern Ireland). About one third of all vacancies nationally are notified to Jobcentres. These could include some that are suitable for young people and similarly vacancies notified to careers offices could include some to radults. The figures represent only the number of vacancies notified by employers and remaining unfilled on the day of the count. Because of possible duplication and also due to a difference between the timing of the two counts, the two series should not be added together.

For further information, please see the article 'Jobcentre vacancy statistics' on pp159-162, Labour Market Trends, March 2001

The introduction of Employer Direct, which is a major change which involves transferring the vacancy taking process from local Jobcentres to regional Customer Service Centres, has affected the data since May 2001.

Employer Direct is being gradually introduced across Great Britain as part of Modernising the Employment Service (ES) and has the following effects

A temporary reduction in the recorded level of outflows and placings owing to some delays in following up vacancies with employers associated with the introduction of the new arrangements.

An increase in the level of newly notified vacancies. Both the above effects lead to an increase in the recorded stock of unfilled vacancies

Investigations by ES show these effects are substantial for all the vacancy series. While they cannot be quantified precisely, the current effects are large enough to prevent meaningful comparisons overtime. These distortions will also persist at least until after Employer Direct has been fully implemented in all regions at the end of January 2002. Publication of the Jobcentre vacancy statistics has therefore been deferred. ONS and ES will continue to monitor and review the data with the aim of re-instating the series as soon as possible.

The publication of the vacancy figures for Northern Ireland has been suspended since March 1999 as a result of a discontinuity identified during the introduction of a new computer system for processing vacancies to local offices of the Department for Employment and Learning (DEL). In the course of correcting for this difficulty, further problems of a procedural nature have also come to light as contributory factors. These further issues have delayed the re-instatement of published vacancy figures for Northern Ireland. DEL have now introduced a new internet-based operational system for vacancies and are investigating how the statistics might be resumed using this. The series will be reinstated as soon as possible. For the purposes of the seasonally adjusted United Kingdom figures is have been assumed provisionally that the Northern Ireland figures have remained constant since February 1999 as follows: 8,900 for the stock of unfilled vacancies, 3,400 for inflows of vacancies notified, 3,400 for outflows, and 2,200 for placings. These are not estimates for Northern Ireland but assumptions for the purpose of continuity of the United Kingdom series up to April 2001.

The vacancy stock figures for Great Britain have been affected by corrections to the data by the Employment Service to make up for the gradual build-up of inaccuracies. The figures were corrected on 8 October 1999 to give a true reflection of the number of open vacancies held by the Employment Service. This had an upward effect of some 10,300 on the recorded stock of unfilled vacancies for Great Britain between September and October 1999 and three was a corresponding downward adjustment to the outflow for October, but not to the placings. There was a similar upward correction to the vacancy stocks (and a downward effect on the outflow) of 9,100 between March and April 1999.

There was minor discontinuity due to a change in the treatment of vacancies by the Employment Service between April and May 2000. As from 7 April both vacancies notified and placings are only counted in the statistics if the vacancy concerned is for 8 hours or more in a 7-day period. Previously vacancies of between 3 and 8 hours were included. The change is estimated to have reduced the recorded inflow of notified vacancies by some 4,000 to 5,000 per month since April.

The taxes excluded are Council Tax, VAT, duties, car purchase tax and vehicle excise duty, insurance tax and airport tax.

Note: Indices are given to one decimal place to provide as much information as is available although accuracy is reduced at lower levels of aggregation. For this reason, annual percentage changes for individual sections are given rounded to the nearest whole number.

See general notes under Table H.13.

Shown below are key items selected from the General Index of Retail Prices. The average prices for these goods have been derived from prices collected in more than 147 areas in the United Kingdom.

vary between retail outlets.

per500g	DOIB	208	81	42-100	petrol, per litre				

Or Scottish equivalent. Average price estimates include prices of delivered milk and shop-bought milk. However, 80 per cent price range includes only shop-bought milk. From February 1999, prices for these items are quoted as per kg. In order to calculate the price per lb (the previously published measure), divide the given price per kg by 2.203. In the case of mushrooms, in order to calculate the price per 402 (the previously published measure), divide the given price by 8.812. From February 2000, 4-star petrol and derv were replaced with lead replacement petrol and ultra low sulphur diesel respectively.

General notes -retail prices

The RPI is now published in full in the ONS Focus on Consumer Definitions Price Indices.

Structure

With effect from February 1987 the structure of the published components was recast. In some cases, therefore, no direct comparison of the new component with the old is possible. The relationship between the old and the new index structure is shown in Employment Gazette, p379, September 1986.

Seasonal food: items of food the prices of which show significant seasonal variations. These are fresh fruit and vegetables, fresh fish, eggs and home-killed lamb.

Enquiries: 020 7533 5874

RETAIL PRICES Average retail prices of selected items

It is only possible to calculate a meaningful average price for fairly standard items; that is, those which do not

The averages given are subject to uncertainty, an indica-tion of which is given in the price ranges in the final column below. These show the range within which at least fourfifths of the recorded prices fell.

Consumer durables: Furniture, furnishings, electrical appliances and other household equipment, men's, women's and children's outerwear and footwear, audio-visual equipment, records and tapes, toys, photographic and sports goods.

For the February, March and April 1988 indices the weights used for seasonal and non-seasonal food were 24 and 139 respectively. Thereafter the weight for home-killed lamb (a seasonal item) was increased by 1 and that for imported lamb (a non-seasonal item) correspondingly reduced by 1, in the light of new information about the relative shares of household expenditure. The nationalised industries index is no longer published from December 1989. b

Note: See general notes under Table H.13.

National Statistics Website

Your introduction to National tatistics key products and services.

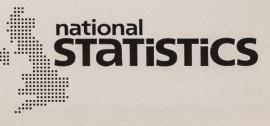

Data free online

Use official statistics? Now spend less time searching
for the data you need. Access National Statistics online.
Visit the new website which brings together a broad
range of statistics from Government departments.
The site is organised into thirteen subjects "Themes" - and offers a simple and quick route map to
all our products and services as well as free access to
both PDFs of our books as well as a database full of
statistical information and data.

Harmonised Indices of Consumer Prices (HICPs) are being calculated in each member state of the European Union for the purpose of international comparisons. This is in the context of one of the convergence criteria for monetary union as required by the Maastricht Treaty. The rules underlying the construction of the HICPs for EU member states were published in a Commission Regulation 9 September 1996. The HICPs replace the Interim Indices of Consumer Prices which were published by Eurostat in a monthly news release. Percentage change figures for 1996 are estimated. Figures for Information of International comparison of a quarterly basis.

 Labour disputes in 2001 Trade union membership 2000-01 Labour Market Trends is a monthly journal of news, analysis and data about the labour market in the United Kingdom.

Each month a summary of key indicators such as employment and unemployment rates, economic activity and inactivity, average earnings, productivity and unit wage costs, and vacancies is presented. A range of reference tables give wider coverage in even greater detail. News, research, topical interest items and feature articles provide an up-to-date picture of the everchanging labour market. Expert analysis and thoughtful commentary on the huge range of data available are featured, as well as advice on statistical quality and methodology issues.
