eadlines

Bising employment indicated by October-December 1998 Labour Force Survey (LFS).

Falling unemployment at a lower rate than in the spring.

Economic activity in the labour market continues to rise, reflecting a further strong rise in employment and fall in inactivity. Latest trend estimates of ILO unemployment and claimant count date show small falls in recent months. Labour Force Survey data for October-December 1998 show that the employment rate rose to 73.8 per cent from 73.6 per cent in the preceding three months and 73.3 per cent a year ago. The ILO unemployment rate was 6.2 per cent, no change from the preceding three months and down from 6.6 per cent a year ago.

- The claimant count fell by 5,700 in January 1999, and has showed an average monthly fall of 6,000 over the last three months and 5,000 over the last six months. Notified vacancies continue at historically high levels.
- Tread estimates from the LFS are available on request from Philippe Ravalet at the Office for National Statistics, e-mail philippe.ravalet@ons.gov.uk, tel. 0171 533 6111.

New this month

- October-December 1998: Latest three-month average Labour Force Survey results;
- anuary data: Claimant count (including latest age and duration analysis), vacancies and placings;
- December data: Manufacturing productivity, manufacturing employee jobs, labour disputes.

SUMMARY

- year earlier (Figure 2, Table A.1).
- year (Table B.1).
- This is 103,000 lower than a year ago (Table C.1).
- 78.5 per cent on a year earlier (Table D.1).
- (Table G.1).
- (Table G.1).

Statistical enquiries Labour Market on pS76.

All figures are seasonally adjusted and for

• Employment rate was 73.8 per cent among people of working age in October-December 1998 period, up from 73.6 per cent in July-September 1998 and up from 73.3 per cent a year earlier (Figure 1, Table A.1).

ILO unemployment rate was 6.2 per cent in October-December 1998 period, unchanged from July-September 1998 rate and down from 6.6 per cent a

• Employment was 27.29 million in October-December 1998, up 305,000 over the

• Workforce jobs rose by 97,000 over the quarter to 27.56 million in September 1998, a rise of 253,000 over the year (Table B.11).

ILO unemployment level was 1.79 million in October-December 1998.

Claimant count fell 5,700 in month to January 1999 to 1.31 million. Claimant count rate in January was 4.6 per cent, unchanged on the month (Table C.11).

Economic activity rate was 78.8 per cent among people of working age in October-December 1998, up from 78.6 per cent in July-September 1998 and up from

Economic inactivity rate was 21.2 per cent among people of working age in the October-December 1998 period, down from 21.4 per cent in July-September 1998 and down from 21.5 per cent on a year earlier (Table D.3).

New vacancies notified to Jobcentres up 9,300 in January 1999 to 229,900

Stock of unfilled vacancies down 2,200 in January 1999 to 306,800

Labour Market trends

87

EMPLOYMENT

- Men in employment up 52,000 since July-September 1998 to 15.06 million in October-December 1998, and women up 70,000 in the same period to 12.23 million (Figure 3 and 4, Table B.1).
- People in full-time employment up 35,000 since July-September 1998 to 20.50 million in October-December 1998. People in part-time employment up 88,000 over the same period to 6.78 million (Table B.1).
- Manufacturing employee jobs down by 85,000 in the three months to December compared with the same three months a year ago, at 4.05 million (Table B 12).
- The LFS estimate of the total number of actual hours worked per week was 900 million during October-December 1998, up 0.6 per cent on October-December 1997. This is due to an increase in total employment of 1.1 per cent over the year combined with a decrease of 0.6 per cent in average actual weekly hours (Table B 21)

UNEMPLOYMENT

- Number of people ILO unemployed for between six and 12 months fell 29,000 over the year to 266,000 in October-December 1998 (Table C.1).
- ILO unemployment over 12 months fell 112,000 in year to stand at 506,000 in October-December 1998 (Table C.1).
- ILO unemployment for those aged 18 to 24 years remained unchanged over the year to at 453,000 in October-December 1998 (Figure 5, Table C.1)
- ILO unemployment rate for UK Government Office Regions (unadjusted) down in all regions over the year except the North East, North West, Merseyside, West Midlands, Wales and Scotland. Highest rate is in North East at 9.2 per cent and lowest is in the South East region at 3.8 per cent (Figure 6, Table C.11)
- Claimant count over 12 months (unadjusted) shows a fall of 54,100 over the year to 344,400 in January 1999 (Table C.12).
- Total claimants aged 18-24 (unadjusted) stood at 327,900 in January 1999, a fall of 47,300 over the year (Table C.12).
- Claimant count over 12 months aged 18 to 24 (unadjusted) stood at 24.700 in January 1999, a fall of 29,100 over the year (Table C.12).
- Number of people in categories affected by New Deal (unadjusted):

	January 1999	Change on year
18-24, over six months	76,990	down 41,427
25 and over, more than two years	165,917	down 50,347
Total	242,907	down 91,774

ECONOMIC ACTIVITY AND INACTIVITY

88

- Number of economically active people was 29.08 million in October-Decembe 1998. Of this total, 16.17 million were men and 12.90 million were women (Table D.1).
- Number of economically inactive people of working age was 7.60 million in October-December 1998. Of this total, 5.26 million people did not want a job and 2.12 million wanted a job, but had not actively looked for one (Figure 7, Table D 2)
- The LFS shows that the net increase in the number in employment of 305,000 in the year to October-December 1998 period was balanced by a decrease in the ILO unemployed of 103,000, a decrease in the number of economically inactive of 46,000. and an increase in the total population aged 16 and over of 156,000 (Table A.1).
- Economic activity rate for men was 84.7 per cent of all persons of working age in October-December 1998, up from 84.5 per cent in July-September 1998, while the rate for women was 72.4 per cent for the same period, up from 72.2 per cent from July-September 1998 (Table D.1).
- Economic inactivity rate for men of working age was 15.3 per cent in October-December 1998, down from 15.5 per cent in July-September 1998, while the rate for women was 27.6 per cent for the same period, down from 27.8 per cent July-September 1998 (Table D.2).

REDUNDANCIES (not seasonally adjusted)

There were 209,000 people made redundant in the period September-November 1998. This compares with 176,000 in the period September-November 1997

Results for the September-November 1998 period showed that 1.1 per cent of male employees and 0.7 per cent of female employees had been made redundant in the three months prior to the interview. Of those made redundant, 44 per cent were back in employment at the time of the interview (Table C.41, February 1999).

Manufacturing output was 0.6 per cent lower in the three months ending December 1998, compared with a year earlier (Table B.32).

Manufacturing productivity in terms of output per filled job was 1.2 per cent higher in the three months ending December 1998, compared with a year earlier

• Whole economy output per filled job was 1.6 per cent higher in the third quarter of 1998, compared with a year earlier (Figure 8, Table B.32).

Publication of unit wage costs data has been suspended, please see note

• UK ILO unemployment rate in October-December 1998 was 6.2 per cent, below the EU average of 9.8 per cent in December 1998 and lower than all EU countries except the Netherlands, Portugal, Denmark, Luxembourg and Austria

• UK ILO unemployment rate among under-25s at 13.7 per cent in October-December 1998 was lower than all EU countries except Denmark, Germany, Luxembourg, Ireland, Austria, Portugal and the Netherlands.

In EU countries there was an average increase in consumer prices of 1.0 per cent (provisional) over the 12 months to December, compared with 1.5 per cent in the UK. Over the same period consumer prices rose in France by 0.3 per cent and in Germany by 0.4 per cent. Outside the EU, consumer prices increased by 0.7 per cent in the USA for November and by 1.0 per cent in Canada for December. Prices fell by

VACANCIES

- New vacancies notified to Jobcentres were 31,400 higher than the same month last year (Figure 10, Table G.1).
- Stock of unfilled vacancies at lobcentres were 33,100 higher than the same month last year (Table G.I).
- Placings by Jobcentres up 8,500 in January 1999 to stand at 126,300 (Table G.1).

LABOUR DISPUTES (not seasonally adjusted)

- Number of working days lost in the 12 months to December 1998 is provisionally estimated to be 277,000, from 155 stoppages. Some 50 per cent of the days lost were in the transport, storage and communication group, 11 per cent were in manufacturing, and 10 per cent were lost in other community, social and personal service activities
- Number of working days lost in December 1998 is provisionally estimated to be 10,300, from 12 stoppages (Figure 11, Tables G.11 and G.12).

TRAINING (not seasonally adjusted unless otherwise stated)

- Seasonally adjusted, 3.4 million (15 per cent) employees of working age received jobrelated training in the four weeks prior to interview during autumn 1998. This is 86,000 more than the previous quarter (Table B.41).
- The number participating in Work-based training for adults in England and Wales as at 1 November 1998 was 35 per cent lower than it was 12 months earlier (Table F.1).
- The proportion of leavers from Work-based training for adults between May 1997 and April 1998 who were in a job six months after leaving was 44 per cent; one percentage point less than a year earlier (Table F.3).
- The proportion who gained a full qualification in the same period was 38 per cent, the same as the previous year (Table F.4).
- The number participating in Other Training (OT) in England and Wales as at 1 November 1998 was 25 per cent lower than in the previous year (Table F.1

- The proportion of OT leavers between May 1997 and April 1998 who were in a job six months after leaving was 65 per cent; the same as for the preceding 12 months (Table E3)
- The proportion of OT leavers who gained a full qualification in the same period was I percentage point higher than for leavers a year earlier (Table F.6).
- The number of people on Modern Apprenticeships in England and Wales wa 133.300 as at 1 November 1998 (Table F.1).

ECONOMIC BACKGROUND

- Gross domestic product (GDP) at market prices in the fourth quarter of 1998 was 0.2 per cent higher than the previous guarter and 1.6 per cent higher than a year earlier
- Retail sales volumes in the three months to December were 0.2 per cent lower than in the previous three months but 1.4 per cent higher than in the same period a year earlier
- Manufacturing output in the three months to December was 1.3 per cent less than in the previous three months and 0.6 per cent lower compared with the same period a year earlier.
- Construction output in the third quarter of 1998 was 0.6 per cent lower than the previous quarter and 0.4 per cent higher compared with the same period a year earlier
- Business investment in the third quarter of 1998 is estimated to be 1.7 per cent higher than the previous quarter and 10.5 per cent higher than the third quarter
- Government consumption in the third quarter of 1998 was up 0.7 per cent on the previous quarter and 2.2 per cent higher than a year earlier.
- The trade in goods balance was down 5.4 per cent in the three months to October compared with the previous three months and down 4.9 per cent compared with the same period a year earlier.

- Excluding oil and erratics, export volumes in the three months to October were 0.2 per cent higher than the previous three months and up 1.2 per cent on the same three months last year.
- Excluding oil and erratics, import volumes in the three months to October were up 2.5 per cent on the previous three months and up 7.1 per cent on the same three months last year.
- The all items retail prices index (RPI) fell by 0.6 per cent over the month to stand at 163.4 for lanuary.
- In the 12 months to January, the all items RPI rose by 2.4 per cent, down from 2.8 per cent for December. The 12-month rate of change for the all items excluding mortgage interest payments index stood at 2.6 per cent for January, unchanged from the figure for December
- The main downward effect on the all items 12-month rate came from housing costs. due to a fall in the mortgage interest payments component as recent cuts in interest rates are again passed on to borrowers. A smaller downward effect also came from price changes for household goods, particularly furniture, where the recent trend of larger pre-Christmas price increases followed by steeper reductions in January continued. There we also slight downward effects from price changes for seasonal food and alcoholic drinks. The main offsetting upward effects came from prices for non-seasonal food, in particular potato products reflecting recent price increases for potatoes. A further upward effect came from fuel and light charges. This was as a result of last year's price reductions for gas, due to increased competition, dropping out of the index, and also crude oil prices firmin up in contrast to last year's falls. A smaller upward effect came from motoring costs.

Next month

ONS to reinstate average earnings series

THE OFFICE for National Statistics was due to reinstate the Average Earnings Index (AEI) from 2 March 1999, after this issue of Labour Market Trends went to press. The Chambers Report, commissioned by ONS to quality assure the work put into producing the AEI, was due to be published on the same day, as was the Turnbull/King Report, initiated by the Chancellor of the Exchequer to review average earnings revisions.

The announcement of the AEI reinstatement was made on 26 February. It stated that figures up to December 1998 would be released in an ONS First Release,

LFS grossing – outcome of consultation

ARTICLE "LFS grossing: the management of change" in the November issue of Labour Market Trends out ned a number of issues relating to the gressing of the Labour Force Survey, and sought the views of users on a number of specific users.

NS and the key users of LFS data have had an opportunity to consider responses to this article, and have decided upon a strategy. The key elements of this are: · LFS data for periods back to autumn 993 will be regrossed using the most -to-date population estimates available opulation estimates for periods before 193 have not been revised since the LFS grossing control totals were tablished, so no regrossing prior to this currently required) and using the same

thodology as at present. s long a time series as possible will be

made available for unitary authorities.

• The special LFS household databases which are produced for spring and autumn quarters, each year, and which use the single household weight method will be regrossed to the same population figures as will be used for the main databases.

- · The regrossed LFS data will be made available from April 2000, or sooner. In advance of their release an article in Labour Market Trends about the key characteristics of the regrossed data will be published, and a programme of seminars will be arranged to explain to LFS users why the changes are being introduced, and what the statistical implications are likely to be.
- · Future grossing control totals will be modified using a 'wedging' process in order to minimise discrepancies between the most recent population estimates and those used for grossing purposes.

Ethnic Minorities Key Facts

A CONCISE factsheet on Britain's ethnic minorities has been produced by the Department for Education and Employment (DfEE). It contains information on various aspects of life, including the geographical distribution of the ethnic minority population, unemployment and income.

Nearly six out of ten ethnic minority people lived in the South East in 1991: Greater London alone contained 45 per cent of all the ethnic minority population of Great Britain. In 1994-95, more than 60 per cent of Pakistani/Bangladeshi households were in council estates and low-income areas, compared with only 40 per cent of Black and Indian households.

Whites have higher employment rates and lower unemployment rates than ethnic minority groups, for both men and women. However, the variation in employment and unemployment rates among the various ethnic minority groups is greater than that between ethnic minorities as a whole and White rates. For 16 to 24-year-olds, unemployment is highest among the Black groups.

Ethnic minority graduates had to apply for a greater number of jobs, and took longer, to secure their first post. Graduate recruiters are tending to target a select number of universities, often the most

News and research

ONS NEWS

Rusines Insuine 1009

which would also include backdata and an explanation of the methods used to construct the index. It would be available on the Statfax fax retrieval service from 10.30 a.m. on 2 March.

AEI data will reappear in the Labour Market Data section of the April issue of Labour Market Trends.

• It is likely, once the results of the 2001 Census of Population have been analysed, that population figures for the 1990s will be reviewed. If this is the case, ONS will undertake a subsequent LFS regrossing exercise in order to maintain consistency between population and labour market estimates. At this stage ONS will reconsider the merits of switching to the use of single household weights, and in the interim will explore ways of minimising the discontinuity which would otherwise arise in mid-1996 (further details included in the November 1998 article)

Further details are available from Richard Laux (Room B2/08, Office for National Statistics, 1 Drummond Gate, London SW1V 2QQ, e-mail richard.laux @ons.gov.uk, tel. 0171 533 6133).

DIEE NEWS

academic, which have low representation of ethnic minority graduates. Ethnic minority graduates are more likely to feel slightly underemployed in their current job, with 31 per cent of saying this, compared with only 18 per cent of White graduates.

The factsheet draws on a number of sources of information, including the 1991 Census, the Labour Force Survey, the Family Resources Survey and research commissioned by the DfEE.

• Ethnic Minorities Key Facts. Available free from EORP1, Room W601, Department for Education and Employment, Moorfoot, Sheffield S1 4PO.

OTHER NEWS

Students and graduates

TWO NEW reports from Incomes Data Services (IDS) look separately at a marked slowdown in job prospects for graduates, and the large expansion in fulltime students who are also in employment.

A survey of major employers of graduates found that after five years of high growth, in which they have regularly predicted percentage increases in double figures in their demand for graduates, employers expect to take on an extra 6.8 per cent in 1999

Last year, employers recruited 4.7 per cent more graduates than in 1997, a relatively low figure and one that fell well short of predictions made 12 months earlier. Some 42 per cent of employers surveyed said they were unable to fill all their vacancies last year because of a shortage of good candidates and nearly half believed that the quality of graduates had declined. There was a particular shortage of quality candidates in technical areas such as engineering and IT.

The report shows that, while there was an overall increase in the demand for graduates in 1988, this was very uneven across different sectors. In the public sector and manufacturing the numbers recruited actually fell by 17.4 per cent and 1.2 per cent respectively. In contrast, finance organisations took on 14.3 per cent more graduates, and service companies reported an increase of 6.7 per cent. A similar uneven pattern is predicted for 1999: finance companies plan to take on 19.2 per cent more graduates than they did last year, while the public sector has predicted a rise of only 2.5 per cent.

An assessment of starting salaries for graduates found that there was a 'modest' median increase of 4.8 per cent in 1998, with an even lower median increase - 3.1 per cent - predicted for this year. The median starting salary in 1998 was £16,500 compared with an expected £17,225 for this year. The highest paying sector last year was service industry, with a median starting salary of £17,000, but this is expected to be overtaken by manufacturing in 1999, where the median is predicted to be £17,500.

- Other findings from the survey included: • starting salaries for new graduates in 1998
- ranged from £11,500 to £26,000; increasing competition and recognition of students' financial situation have led 31 companies to improve the overall remuneration package through measures such as joining bonuses;
- more than 25 per cent paid a premium for candidates with higher degrees or relevant experience;
- the median retention rate for graduates recruited in 1995 was 75 per cent with an average salary of £23,544;
- · following an initial interview, nearly twothirds of employers use an assessment centre and more than a third use psychometric testing;
- advertising in the national press is the most popular method for attracting graduate applicants, although the Internet is increasingly popular with 47 companies using it for recruitment purposes.

A total of 109 organisations responded to the survey, which was the thirteenth carried out by IDS on graduate recruitment, pay and progression

The growth in the number of full-time students who are also in employment is analysed in a separate report. Using data from the Labour Force Survey (LFS), the report shows that the proportion of students (those aged 16 to 24 in full-time education) in Great Britain who were also in

employment rose from 23 per cent in 1984 to 38 per cent in 1998. During this period the student population rose by 72 per cent (from 1.37 million to 2.36 million) while the number who were also in employment increased by 180 per cent (from 319,000 893.000).

The report says that whereas student employment was once considered as casual labour it is now regarded as structural. The expansion of shopping hours into evenings and Sundays, along with more emphasis o fast food and late night catering, has resulted in the creation of huge numbers of part-time jobs that suit students.

According to the spring 1998 LFS, the retail sector employs more students that any other industry, with hotels and restaurants the next largest employer. Th proportion of students employed different retail companies, along with pay and benefits they receive, is assess by IDS. Sainsburys employs the highnumber of students at 30,000, which accounts for 24.4 per cent of supermarket workforce, while Pizza H employs the highest proportion, 60 per cer of its total workforce of 11,000.

Other notable employers of studen looked at by the report include Teso (16,000 students in total - 10.3 per cent of workforce), Safeway (14,268 - 20.7 p cent); Kwik Save (8,330 - 40 per cent Waitrose (7,000 - 35 per cent); and Morrisons (5,198 - 16.9 per cent). Severa companies, particularly Asda and Pizza He enable students to transfer to a store ne their home during term breaks.

• Pay and progression for graduates 1998/-£58. IDS Report 776, available as part of a three month trial subscription, £30. IDS, 77 Bastw Street, London EC1V 3TT, tel. 0171 250 34.

NACETT – change of address

The National Advisory Council for Education and Training Targets has moved.

Its new address is: Dunford Lodge, Storth Lane, Ranmoor, Sheffield S10 3HN, tel. 0114 259 7887, fax 0114 259 7580.

A REPORT from the Institute for Social and Economic Research looks at the incomes of people from ethnic minorities. This shows a considerable diversity among members of the ethnic minorities on many measures, Chinese and Indian people were doing as well as White families, whereas considerable poverty was found among Pakistanis and Bangladeshis.

he report draws mainly on two statistical sources - the Fourth National Survey of Ethnic Minorities, conducted in 1994, and the 1994-95 and 1995-96 rounds of the Family Resources Survey (FRS), which between them sampled over 2,500 ethnic minority households.

he FRS data showed that average earings of working families (those with anyone of working age in a job) were highest among the Chinese (an average of £314 a week when the survey was conducted) and Indians (£305), and lowest among Pakistani/Bangladeshi families (£174). White families had average earnings of £298. Very few White, Chinese or Indian working families also claimed means-tested benefits, suggesting that their incomes were too high to make them eligible (fewer than 10 per cent claimed in each case). By contrast, many more working families from the Caribbean, African and Pakistani/Bangladeshi groups claimed - 16, 19 and 29 per cent respectively.

An important point to emerge from the analysis was the great variation across ethnic groups in the chances of having no-one in the family in work. After taking out teenagers, lone parents and the over-60s so

Labour market statistics quarterly update

I abour Market Statistics Quarterly Update is designed to inform users about developments taking place as part of ONS' continuing work to improve labour market statistics. It will appear in every quarter in March, June, September and December.

nprovements introduced

ecember-February 1999

A new booklet, What Exactly is the LFS?, was published. The booklet provides an easily accessible and user-friendly explanation of the workings of the Labour Force Survey (LFS). It is available from the Labour Market Statistics helpline. Contact: Labour Market Statistics Helpline, 0171 533 6094.

En ployee jobs and workforce jobs estimates drawing on the revised 1995 and 1996 Annual Employment Survey (AES) data, and including 1997 AES data for the first time, were published within the December 1998 integrated First Release. The data were subsequently published in the January 1999 Labour Market Trends data tables. The figures are approximately 400,000 higher than be ore, due to the inclusion of more small businesses. Users should note that this introduces a step in the employee jobs series at 1905. An article about this and other aspects of the AES appears in this edition of Labour Market Trends. It discusses the 1997 AES results in detail, presenting summary results by industry and by county. Contact: James Partington, 01928 792545.

ork in progress

ONS has been reviewing its national and regional labour market statistics First Releases. The consultation period ended in Ocober 1998, by which time over 70 responses had been received. Work is now underway to revise the releases, and the new versions will be introduced in April. Changes to the Labour Market Trends data section resulting from changes in the national First Release will be introduced in the May edition. Contact: Neil Dubé, 0171 533 6107.

ON3 is scheduled to reintroduce the Average Earnings Index on 2 March 1999 after this issue has gone to press (see news item on p91). Contact: Derek Bird, 01928 792614.

Adecision will be taken in April on the replacement of the AES by the Annual Business Inquiry - for more details see the article on p149-152 of this issue. Contact: James Partington, 01928 792545.

The full back revision of the employee jobs series on the new basis is under way - this will remove the step in 1995 referred to above. Contact: James Partington, 01928 792545.

ONS is working with the Local Government Management Board (LGMB) to put in place new arrangements for collecting employee information from local authorities. The old quarterly survey run by LGMB will be replaced by a new survey conducted by ONS. This will provide similar detail to the old survey, but will be more closely aligned with the other quarterly employee surveys underpinning the employee jobs estimates. The new collection arrangements will start in March. Contact: James Partington, 01928 792545.

New tables will be introduced in the data section of Labour Market Trends in April or May covering the New Deal. There will also be an article describing the source of the statistics. Contact: Frances Sly, 0171 533 6141.

A programme of research into the customer base for labour market statistics products started in January 1999 with the objective of informing a review during 1999 of all ONS labour market publications and the scope for new products. Contact: Frances Sly, 0171 533 6141.

Areview of the derivation of redundancy statistics from the LFS is being undertaken with a view to improving the documentation on the quality of these statistics. An article will be published in Labour Market Trends in the near future. Contact: Tim Thair, 0171 533 6142.

Work is continuing on the production of a UK historical supplement to complement the LFS Quarterly Supplement. It will be published in two parts: the first will contain annual data (spring quarters), and will be published on 24 March 1999. Seasonally adjusted quarterly data back to 1992 will be published mid-year. Contact: Lester Browne, 0171 533 6143.

Work in progress – continued

ONS has conducted a second study linking LFS data and administrative records for people claiming unemployment related benefits. The results of the first study appeared in 'LFS estimates of claimants of unemployment-related benefits: results of an ONS record linkage study', pp455-60, Labour Market Trends, November 1997. The second study was carried out to produce information on the economic activity status of claimants after the introduction of the Jobseeker's Allowance in 1996 and an article is due to be published shortly. Contact: Nigel Stuttard, 0171 533 6167.

An analysis of benefits data from the LFS is underway. Results of the analysis will be published in a Labour Market Trends article mid-year. Contact: Richard Laux, 0171 533 6133.

An analysis of data on owner-managers from the LFS is also underway. Results of the analysis will again be published in a Laboratory Market Trends article mid-year. Contact: Richard Laux, 0171 533 6133.

A Guide to Regional and Local Labour Market Statistics will be published in June. Contact: Ann Blake, 0171 533 6130.

ONS is working to make more core labour market data available electronically by mid-year. Contact: Frances Sly, 0171 533 6141

Future developments

ONS is undertaking an evaluation of interviewing mode effects, and repeat interview effects, on LFS estimates. Results of the evaluation will be published in the latter part of 1999.

ONS is working on a number of improvements to the quality and range of data available for small areas. In the short term this w mean publishing claimant count rates for a wider range of geographies than at present. In the longer term it is expected to ma LFS data available for a wider range of geographical areas, and improve the quality of unemployment rates for small areas bas on internationally agreed definitions.

A new booklet, How Exactly is Earnings Measured?, is planned for release during 1999.

A new method is being considered for calculating productivity growth - the denominator will change to reflect hours worked which is a more refined measure than the headcount measure currently used.

ONS is working on the methodological issues which need to be addressed in order to produce longitudinal datasets from the LFS

Labour Market Spotlight

Every month Labour Market Spotlight highlights statistics of topical or general interest in a clear and straightforward presentation. It aims to foster awareness and understanding of labour market statistics from a range of sources. Your suggestions for topics to be included are welcomed. Distribution of usual time taken to travel to work by employees and self-employed working at a place separate from home;

nl Businnes Innuinu 1000

In the autumn quarter the LFS asks those who work at places separate from their home how long (in total) it usually takes to travel to work. Underlying the overall average time taken to travel to work of 24 minutes is a wide range of journey times. Table 1 shows the average usual time taken to travel to work. Figure 1 shows the distribution of travel times by full- and part-time workers.

- Full-time workers took, on average, nearly ten minutes longer to reach their place of employment than parttime workers (27 minutes compared with 18 minutes).
- Men took on average six minutes longer to get to work than women did (27 and 21 minutes respectively). Half of this difference is explained by the fact that men are more likely to work full-time and full-timers tend to have longer journeys.
- The most frequent usual time taken to travel to work was ten minutes or less; a half of part-time, and over a quarter of full-time workers were in this time-band.
- Some 43 per cent of full-timers took more than 20 minutes to get to work, compared with 23 per cent of parttimers.
- The most significant regional variation in time taken to travel to work was among those who work in London. Employees and selfemployed whose jobs were in central London took, on average, 55 minutes to get to work.

Labour Market trends

97

2 Job-related training

Learning throughout working life is becoming increasingly necessary because of the pace of change within the labour market, and training is seen by a large number of both employers and employees as an essential investment for the future. Many requests for LFS data about training are received by the DfEE workforce training enquiry point (0114 259 3489).

Figure

Men

In autumn 1998, 3.5 million employees of working age - 14.9 per cent of all such employees received job-related training in the four weeks prior to interview (seasonally adjusted).

Figure 2 shows the proportion of working-age employees in receipt of job-related training by occupation and Figure 3 breaks the data down by industry.

- A higher proportion of female than male working-age employees had received jobrelated training in the UK during autumn 1998 - 16.4 per cent and 14.5 per cent respectively (not seasonally adjusted).
- Among both men and women, employees in professional occupations were more likely than any other occupation group to have received jobrelated training (24 per cent and 31 per cent respectively).
- O Craft and related was the occupation group with the greatest relative difference between the proportions of male and female employees receiving training (11 per cent for men and only 5 per cent for women). There is a great deal of 'occupational segregation' within this group with female employees being concentrated in occupations such as textile trades, where job-related training is generally less common.
- The public administration, education and health industry sector experienced higher levels of job-related training than any other industry group. This was true for both men and women (24 and 22 per cent respectively).
- Overall, employees in the agriculture and fishing industry group were least likely to receive job-related training (7 per cent).

40

A. S. S. A.	
ljusted	The Labour Market Statistics Helpline receives many calls about the economic status of people in
ILO ployment rate (%)	different ethnic groups. Some of the most commonly requested breakdowns are provided in <i>Table 2</i> .
All 10*	• According to the LFS, there were
5.8	minority groups in Great Britain
12	in spring 1998 over the age of
14	16, of whom 1.3 million were in employment
20	• Among the ethnic minority
*	groups, Blacks had the highest
3	rate at 73 per cent, but the Indian grouping had the highest
6.4	employment rate at 66 per cent.
13	group had the highest ILO
16	unemployment rate, with one in
/	tive of the economically active
*	just over one in 20 economically
13	active White people).
	• All ethnic groups had lower
5.0	men. The largest difference was
12	for the Pakistani/Bangladeshi
12	group, where the rate for men
8	was two-and-a-nan times that for women.
21	
*	Figure 4 shows the density of
12 rce Survey	employees according to their ethnic group.
maller)0.	Black employees (who had the highest levels of unionisation) were approximately twice as likely as those of Pakistani/Bangladeshi or Chinese ethnic origin to be in a union (36 per cent, 18 per cent and 16 per
	cent respectively). The low levels of
	union membership among Pakistani/Bangladeshis and Chinese are partly a reflection of the fact that large proportions of these groups are employed in the distribution, hotels and restaurants industries (which

Labour Market trends

have below average levels of

unionisation). By contrast, Black

employees are far more likely

than any other group to

be employed in the public

administration, education and

health industries, which tend to

minorities were marginally less

likely than their White

counterparts to be members of a

union (28 per cent compared

• Overall, employees from ethnic

be highly unionised.

with 30 per cent).

99

Disabled people and the labour market

A regular topic of interest among callers to the Labour Market Statistics Helpline is the labour market status of disabled people. It is possible to define disability/long-term health problems in a number of ways in the LFS and the number of disabled people varies with the definition used. In this feature, data is shown for three definitions: those with a disability/long-term health problem that limits the kind or amount of paid work that they can do (referred to as a work-limiting disability); those classified as currently disabled according to the Disability Discrimination Act (DDA) 1995; and all those who are long-term disabled on either definition (see red box). It is important that users should be aware of the different definitions in order to select the one most suitable for their needs. Table 3 gives economic activity, employment and unemployment rates for each of the definitions of disability.

- In autumn 1998 there were 6.4 million people of working age with long-term disabilities in the UK, just over half of whom were men (53 per cent) - a similar ratio was evident among those with a current disability covered by the DDA and those who were work-limiting disabled (52 per cent and 54 per cent respectively).
- Although the economic activity rate for those who were work-limiting disabled was similar to that for those who had a current disability covered by the DDA (44 per cent compared with 45 per cent), the activity rate for those who were both DDA and work-limiting disabled was much lower (34 per cent), while the average for all who are long-term disabled is higher (51 per cent).
- People without long-term disabilities (on either definition) were twice as likely to be in employment (80 per cent) as those who have either a current disability covered by the DDA (40 per cent) or a worklimiting disability (38 per cent).
- Among the economically active, people with work-limiting disabilities were the most likely to have been ILO unemployed (13 per cent compared with 6 per cent of those without disabilities).

More detailed analyses of disabilities data will appear in a future issue of Labour Market Trends.

LFS definitions of disabilities

From spring 1997 the LFS asks all its working age respondents:

Do you have any health problems or disabilities that you expect will last more than a year?

If they answer yes to this question, they are also asked to say what kind(s) of health problem or disability(ies) they have, based on a list read to them by the interviewer.

If they then answer yes to the following question:

• 'Does this (do these) health problem(s) or disability(ies) (when taken singly or together) substantially limit your ability to carry out normal day-to-day activities?

March 1999

They said that they had the following health problems: 'progressive illness not included elsewhere (e.g. cancer, multiple sclerosis, symptomatic HIV, Parkinson's disease, muscular dystrophy)'

then they are defined as having a current disability covered by the DDA.

People whose health problem(s) or disability(ies) are expected to last more than a year are also asked the following questions:

- 'Does this health problem affect the KIND of paid work that you might do?'
- ... or the AMOUNT of paid work that you might do?'

If the respondent fulfils either of these criteria, they are defined as having a work-limiting disability.

Those who meet the criteria for either (or both) DDA or work-limiting definitions of disability are described as long-term disabled.

For more information see 'Disabilities data from the LFS', Labour Market Trends, June 1998, pp321-35.

People with second jobs

Percentage of employees and self-employed who have second jobs, by occupation and industry in main job; United Kingdom, autumn 1998, not seasonally adjusted

upations are coded according to the Standard Occupational Classification.

- ncludes a small number of people who did not state their occupation or industry (in main or second job). ndustries are coded according to the Standard Industrial Classification.
- The figures shown in brackets are the number (in thousands) who have a second job according to the occupation and industry of their main job.

The LFS collects a variety of data on the nature of second jobs and the people who hold them. Figure 5 shows the proportion of employees and self-employed who have second jobs according to their occupation and industry in their main job.

- In autumn 1998 people who were employed in personal and protective occupations (in their main job) were the most likely to have a second job (7.3 per cent). This was more than three times the rate for people working in the craft and related occupations group (2.3 per cent).
- There was a marked difference between those occupations in which relatively high proportions of people had a second job (personal and protective, professional, associate professional and technical, and 'other') and those where few did. In the former, approximately half of those working in a second job were doing so in the same occupation category as their main job; in the latter, only a quarter did so.
- The above finding may be a reflection of the distribution of second jobs across occupation groups. Occupations with smaller proportions of employees and self-employed taking second jobs also had the smallest number of second jobs, i.e. plant and machine operatives (45,000 as second jobs), craft and related (49,000). This compares with 313,000 and 179,000 respectively for the personal and protective and professional occupation groups.
- At a more detailed level, some of the most common occupations in which people had second jobs were teaching (114,000); cleaners and domestics (105,000); literary, artistic and sports professionals (82,000); bar staff (80,000); sales assistants (72,000); and childcare occupations (71,000).
- The industry group with the highest proportion of employees and selfemployed with second jobs was public administration, education and health (7.7 per cent) which had three times the rate for both construction and manufacturing.
- The only industry group in which more than half of people with second jobs were working in the same industry as their main job was public administration, education and health. Again, this might reflect the availability of second jobs - more than one third of all second jobs were in this industry group.

Prepared by the Government Statistical Service

6 Homeworkers

In the LFS homeworkers are defined as those who work mainly in their own home (see red box). Table 4 gives the number of employee and selfemployed homeworkers, those who worked in the same grounds or buildings as home, and those who used their home as a base, for autumn 1998

There was a total of 625,000 people (2.3 per cent of all employees and selfemployed) working as homeworkers in their main job in autumn 1998.

- Of those who were homeworkers in their main job, 56 per cent worked part-time and 68 per cent were women
- In their main job, 7.3 per cent of all employees and self-employed people did paid work in different places using their home as a base and a further 1.3 per cent worked in the same grounds or buildings as home
- In their main job men were far more likely to be working in different places with their home as a base than were women (10.5 per cent compared with 3.5 per cent). This difference is largely explained by the fact that nearly one-third of all such jobs were in the construction industry, and men accounted for almost all of these.
- There was a total of 168,000 people working as homeworkers in their second job in autumn 1998 (13.2 per cent of all employees and self-employed with a second job).
- Of the 43,000 homeworkers doing unpaid work for a family-owned business, the majority were women (34,000).

Those who were homeworkers in their main job are shown according to their occupation in Figure 6.

- Those working in the associate professional and technical occupation group were most likely to have been homeworkers (4 per cent), while very few plant and machine operatives came into this category (1 per cent).
- Around two-thirds of professional homeworkers were men, but 19 out of 20 personal and protective homeworkers were women (84 per cent of all personal and protective homeworkers were women working in childcare and related occupations).

Defining homeworkers

The LFS asks all employees, self-employed and unpaid family workers the following question about the location of their work:

(In your main job) Do you work mainly

- I. In your own home
- Often part of the living accommodation is set aside for the purpose of work.
- 2. In the same grounds or buildings as home
- if the place of work is a separate unit attached to the respondent's home (e.g. a doctor's surgery, or farmers who work in fields or buildings adjacent to their home). This aims to capture tied accommodation, rented or owned, with business premises attached.
- 3. In a different place using home as a base
- I many self-employed people, such as builders, may use their home as a base (e.g. as an office) but mainly work elsewhere. This group also includes mobile workers (e.g. mobile hairdressers and mechanics). 4. Or somewhere quite separate from home?

March 1999

Women in the labour market: results from the spring 1998 LFS

By Tim Thair and Andrew Risdon, Labour Market Division, Office for Nationa

ey points

Between 1988 and 1998 the economic activity rate for women of working age (16-59) increased from 70 per cent to 72 per cent; for those with children aged under five it rose from 45 per cent to 55 per cent. For men, it fel from 88 per cent to 84 per cent.

in spring 1998, 44 per cent of all se of working age in employment were women, up from 42 per cent in sping 1988.

in 1998 women represented 33 cent of all those working full-time 81 per cent of all those working -time. Some 44 per cent of nen in employment worked part-(two percentage points higher tim in 1988), compared with 8 per tha cent of men (up from 5 per cent).

ome 53 per cent of all workingage women in employment worked ree major occupation groups clerical/secretarial, personal and projective services, and sales. These occupations account for only 19 per cent of employed men.

• Around 86 per cent of employed women worked in the service industries, compared with 60 per cent of men.

In spring 1998 women with higher qualifications (above A-level) had the highest economic activity rates, 86 per cent compared with 50 per cent for unqualified women. Among those with children aged under five, the rates were 76 per cent for highly qualified women and 27 per cent for those without gualifications.

• The percentage of women in employment in the top two social classes (professional and managerial/ technical) rose from 24 per cent in 1984 to 34 per cent in 1998. The increase for men was from 32 to 40 per cent.

This article presents a range of statistics for the United Kingdom from the spring 1998 Labour Force Survey dealing with the participation of women of working age in the labour market. It focuses on women's levels of economic activity, the types of jobs they do and how this relates to any family commitments they might have.

Introduction

THIS ARTICLE is the latest in a series of reports that bring together a wide range of results from the Labour Force Survey (LFS) to describe the participation of women of working age in the labour market and the types of work they do. Most of the data are derived from the spring 1998 quarterly survey, which was carried out during March, April and May 1998, but some comparisons over time are also given.

All data relate to those of working age: women aged 16-59 and men aged 16-64. None of the figures has been seasonally adjusted but, for maximum comparability, figures are only provided for the spring quarters. Summary tables (identified by numbers) and charts are included in the main body of the text and more detailed tables (identified by letters) appear after the technical note.

Further tables showing a range of LFS results for women and men aged 16 and over are published in the LFS Quarterly Supplement (QS). Key LFS tables also appear in Labour Market Trends each month, and a full set of LFS tables giving LFS estimates for time series back to 1984 where available, for most of the QS tables, are given in the LFS Historical Supplement. The trends for all those aged 16 and over are virtually identical to those for people of working age although, of course, economic activity rates are lower and the numbers in each category are higher for all those aged 16 and over.

Labour market participation

Over the last decade women have increased their share of the UK labour

Figure

100

Classification based on respo dents' self-asses

force, and by spring 1998 they represented 44 per cent of the total. Table 1 shows that the activity rate for women, at 72 per cent, was two percentage points higher in 1998 than in 1988, whereas the men's rate was four percentage points lower (84 per cent). The increase in women's participation is partly associated with an increase in part-time employment, which is discussed later in this article. More details of the trends in the economic status of women (and men) of working age appear in Table A.

Age

Economic activity rates for women in all age groups are lower than the corresponding rates for men (Figure 1). The greatest difference is for the 25-39 age group when the rate for men is highest at 93 per cent, compared with only 74 per cent for women. The difference reflects women who are at home, often looking after a family (see next section). Among the economically inactive, the proportion of women who said that the reason for their economic inactivity was that they were looking after home and/or family has steadily declined from 58 per cent in 1988 to 49 per cent in spring 1998.

Per cent

Economic status by age; United Kingdom; spring 1998 (not seasonally adjusted)

Marital status

While marriage (here taken to include cohabitation) has a relatively small effect on the economic activity rate of women without dependent children (defined throughout this article as 16 to 18-year-olds in fulltime education and all those aged 0-15), the rate for married women with dependent children is much higher, at 71 per cent, than that for non-married women with dependent children, at 53 per cent (see Table B). Lone mothers are, on average, younger than mothers living in couples, and they also have lower levels of qualifications.1 Factors such as these may disadvantage lone mothers in the jobs market.² The LFS shows that the gulf between lone mothers and mothers who live in a couple remains after age of mother and age of youngest dependent child (see next section) are taken into account.3 Two reasons usually put forward for the remaining discrepancy are the cost and availability of childcare and the disincentives of the benefit system. It is easier for two working parents muc either to arrange their hours to ensure that at least one of them is supervising their children, or alternatively (or additionally) to pay for childcare. A study has shown that many lone parents cite the cost or availability of good-quality childcare as the main constraints on taking up work.4 There is, however, no clear evidence of the effects of the benefits system.

The economic activity rate for married women without dependent children is also higher (77 per cent) than for non-married women without dependent children (72 per cent). The atter includes most students, who have relatively low participation rates.

Women with dependent children

The presence of a dependent child in e family has a major effect on the momic activity of women, as Figure 2 ows. Some 43 per cent of women of orking age had dependent children, d their overall activity rate was 67 per ant (compared with 75 per cent for men without dependent children). Of se with pre-school children (under

Per cent

five years), only 55 per cent were economically active: the rate rose to 72 per cent for those with primary-schoolage children (aged five to ten years), and 78 per cent for those with children aged 11-15. Mothers with dependent children aged 16-18 had the highest economic activity rate (82 per cent).

The economic activity rate of women with dependent children has risen from 61 per cent in 1988 to 67 per cent in 1998. The largest rise was for women whose youngest child was aged under five, to stand nearly ten percentage points above the 1988 figure of 45 per cent (see Figure 3). Women on maternity leave are still in employment and so this rise not only reflects a greater number of women returning to the labour market sooner after the birth of their children than previously, but also an increase in the number who may not leave the labour market at all while having their

Feature

Source: Labour Force Survey

children. The activity rate for women without dependent children is around the same level as in 1988 (75 per cent compared with 76 per cent).

The combined effects of a woman's age and the age of her youngest dependent child can be seen in Table D. The activity rates range from 35 per cent for mothers aged 16-24 with youngest child aged under five, to 85 per cent for mothers aged 40-49 with youngest dependent child aged 16-18. Activity rates for women with dependent children tend to be lower than for those without for each age group except for those aged 50-59.

Ethnic group

The activity rates for women from different ethnic groups vary considerably. In 1997 these ranged from around three-quarters for Black-Caribbean women down to one-fifth for Bangladeshi women.5

Oualifications

The level of qualifications obtained also influences the labour market participation of women. A higher proportion of women without dependent children have no formal qualifications (22 per cent) than those with children (19 per cent - see Table E). The proportion also increases with the age of the youngest child under 16: some 15 per cent of women with a youngest child aged under five have no qualifications; 20 per cent of those with children aged five to ten; and 24 per cent with children aged 11-15. These differences may, however, be entirely age-related and result from the increasing qualification levels of the population over the decades.6 The percentage of women with no qualifications has fallen from 46 per cent in 1984 to 21 per cent in 1998. Over the same period the percentage for men fell from 36 per cent to 15 per cent.

The highest economic activity rates are for women with higher qualifications (i.e. above A-level or equivalent). In spring 1998, 86 per cent of highly-qualified women were economically active, compared with 50 per cent of those without qualifications. This is a similar but more marked effect to that among men, where the economic activity rate falls from 92 per cent of those with higher qualifications to 66 per cent for unqualified men. While the average economic activity rate for women has risen slightly, for those with higher qualifications it has risen eight percentage points from 78 per cent in 1984, but for women with no qualifications it is now nearly nine percentage points lower, down from 59 per cent. Activity rates for men in general were lower in 1998 than 1984, but qualifications have a similar effect. Among men with higher qualifications the rate is only slightly lower, while for men with no qualifications the rate has fallen from 84 per cent in 1984 to 66 per cent in 1998.

Figure 4 shows the combined effects of highest qualification and family status of women on economic activity rates. The effect of qualifications is most marked among women with preschool-age children, where only 27 per cent of unqualified women were

Economic activity rates by highest qualification and age of youngest dependent child; United Kingdom; spring 1998 (not seasonally adjusted)

economically active compared with 76 per cent of highly-qualified women. This effect of qualifications is consistent with the increase over the decade in the participation rate of women with young children noted in the previous section. Well-qualified women also have higher employment rates and lower unemployment rates than the unqualified, as do their male counterparts (see Table E).

Patterns of employment

In spring 1998 there were 11.5 million working-age women in employment, 44 per cent of all workers below state pension age, compared with 42 per cent in 1988. The number of women in employment has risen by 900,000 since 1988, while the number of men in employment is only 71,000 higher (see Table 1).

of women shows a very similar pattern to that for economic activity rates, which is described above.

Source: Labour Force Sum

Women are much less likely than men to take up self-employment.⁷ The self-employment rates (that is, the proportion of all those in employment who are self-employed) were 7 per cent for women and 16 per cent for men in spring 1998. The rate for women has been fairly stable over the last decade, while for men it has been falling in recent years (see *Table A*). On the other hand, women are more likely than men to be in temporary employment. The temporary employment rate was 8 per cent for women and 6 per cent for men in spring 1998.

Working time

Source: Labour Force Survey

In spring 1998, 81 per cent of all people of working age who worked part-time were women (see *Table 1*). Some 44 per cent of women in employment worked part-time, a slightly higher proportion than in 1988 (42 per cent). While a very small proportion of men work part-time, the proportion has increased from 5 per cent in 1988 to 8 per cent in spring 1998, a rise of 484,000. The number of women

Length of time in current employment for women aged 16-59 by age of youngest

working part-time increased by 586,000 (13 per cent) and the number working full-time increased by 360,000 (6 per cent). Among men there was a fall of 384,000 working full-time. There has been an overall shift over this period from full-time to part-time employment coinciding with an increase in the number of women wishing to work (see *Table 1* and *Figure 5*).

In spring 1998 three-fifths (60 per cent) of employed women with dependent children worked part-time, compared with one-third (32 per cent) of women without dependent children. As might be expected, women with younger children – those aged under 11 - are more likely to be in part-time employment than those with older children, 65 per cent compared with 52 per cent.

White women in employment are more likely to work part-time than women from ethnic minority groups.⁸ The distinction between full- and part-time working in the LFS is based on respondents' own assessments. An analysis of the distribution of working hours is also very revealing (Figure 6 and Table F). One-third of women without dependent children work 'standard' hours, i.e. 36-40 hours a week. About 13 per cent work very short hours (up to 15) and a similar proportion -12per cent - work long hours (more than 45). For men, the proportion working standard hours is exceeded by the number working long hours (39 per cent work more than 45 hours), while only 4 per cent work very short hours. In contrast, 24 per cent of women whose youngest child was under 11 years of age worked up to 15 hours per week and 40 per cent worked 16-30 hours a week.

At first sight it may appear that a large number of women in employment are 'under-employed', but in fact 78 per cent of women working part-time in spring 1998 did not want a full-time job (*Table H*). This is particularly true

46 and over

31-35

Women in the labour market: results from the spring 1998 LFS

Feature

for those with children, more than 90 per cent of whom said they did not want a full-time job. This compares with 60 per cent for women without children, although the proportion rises with age and for those over 50 is almost as high (89 per cent) as that for women with children. For young women (and men) aged 16-24 the most common reason for working part-time was that they were students (68 per cent).

Length of time in job

The length of time men and women have worked for their current employer is shown in *Figure 7* and *Table G*. Men tend to stay with the same employer for longer than women; in spring 1998, 36 per cent of men had been with their current employer for more than 10 years, compared with 23 per cent of women with children (28 per cent for women with children). Conversely, 30 per cent of men and 35 per cent of women had been with their employer for less than two years, with the proportion increasing to 38 per cent for women with children aged under 11.

Many women do not leave employment when they have a child, returning to work at the end of their maternity leave. *Table G* shows that more than 40 per cent of women in employment whose youngest child was aged under five had been in their current employment for more than five years.

The proportion of women who work during pregnancy and are back in work within nine to 11 months of the birth of their child has increased dramatically in recent years. According to research by the Policy Studies Institute for the Department of Social Security, in 1979 only 24 per cent of such women returned to work.9 By 1988 this had doubled to 45 per cent and by 1996 the figure was 67 per cent. The women most likely to return to work were those who were older, married, in highincome families, in higher-level occupations, receiving above-average pay. They were also more likely to be working for employers in the public sector or which were operating 'family-friendly' policies.

Occupation

Figure 8 shows the differences between the occupations in which men and women tend to work, using the Standard Occupational Classification (SOC). In spring 1998 only just over half of men in employment worked in non-manual occupations (see *Table 1*), compared with over 70 per cent of women in employment. The major occupation groups in which most women worked were clerical/secretarial (25 per cent), and personal and protective services such as nursing/care assistants, catering and hairdressing (16 per cent). The next largest group is managers and administrators (at 12 per cent), closely followed by associate professional and technical occupations (such as nurses and driving instructors) and sales occupations, both at 11 per cent.

The personal and protective services and sales occupation groups provide more part-time jobs for women than full-time ones. Women form the majority in three major occupational groups: clerical and secretarial (74 per cent); personal and protective services (67 per cent); and sales (63 per cent). These three groups account for over half (53 per cent) of women in employment, compared with less than a fifth (19 per cent) of men. Although it is not evident at the major occupation group level, other occupations are also predominantly female: health associate professionals, such as nurses and midwives etc, at 87

her cent, and teaching at 63 per cent Table I and Figure 8). In many traditionally male occupations, there are still very few women working plant and machine operatives. especially drivers and mobile machine operators (4 per cent), skilled engineering trades (2 per cent), science and engineering professionals (10 per cent) and protective services such as police and fire (13 per cent). Although the number of women employed in many managerial and professional occupations has increased, they still only represent 32 per cent of managers and administrators. Women account for progressively smaller proportions as goes up the management hierarchy, but at all levels these percentages have increased over time.10

Social class

Social class as used in the LFS is derived from occupation as classified under the Standard Occupational Classification and employment status (whether the respondent is an employee, manager, 'foreman', self-employed with employees or without employees). The SOC was only introduced in 1991, but social class has been derived from the basic survey data to be as consistent as possible over time,¹¹ so it is used here to look at trends in the status of jobs held by women.

Since 1984, there has been a large increase in the proportion of employment in the top two social classes (professional, and managerial and technical). *Table J* shows that the percentage of employed women in these groups increased from 24 per cent in 1984 to 34 per cent in 1998, and for men the increase was from 32 per cent to 40 per cent. The share of jobs in these two groups taken by women increased from 34 per cent to 40 per cent.

The increase is greatest among women working full-time, where the proportion in these two groups has risen from 30 per cent to 43 per cent. In fact, the proportion of women working full-time who are in the top two social classes is higher than that

Feature

for men (41 per cent – see *Figure 9*). However, women still only account for just over one-third of all those employed full-time in the top two social classes.

Earnings

Women tend to earn less than men and this partly (but by no means wholly) explained by differences in occupation, age, length of time in employment and part-time employment rates.¹²

Industry

In spring 1998, 86 per cent of women were employed in service industries compared with only 60 per cent of men (see Table K). About 13 per cent of women worked in the manufacturing and construction industries compared with 37 per cent for men. A number of service industries employed more women than men - health and social work (80 per cent women), education (70 per cent), hotels and restaurants, and retail trade (60 per cent). There was also a predominance of women in clothing manufacture, where 70 per cent of workers were female.

ING INAR TES

The fact that women tend to work in service industries and that employment in services has increased greatly, combined with the fact that more women want to work, goes a long way to explaining why employment among women has increased.

Unemployment

The unemployment rate (on the ILO definition) in spring 1998 was 5.4 per cent for women of working age; the equivalent rate for men was 6.9 per cent (see Table 1). During the last recession the unemployment rate rose less sharply for women than men, from 6.6 per cent in spring 1990 to 7.8 per cent in spring 1993 compared with a rise from 7.1 per cent to 12.5 per cent for men over the same period (see Figure 10). Unemployment rates have been falling over the last five years and the unemployment rates for both women and men are now at their lowest rates since the ILO measure was adopted in 1984.

Table 3 shows that ILO unemployment rates for women fall as age increases, from 10 per cent for 16 to 24-year-old women to less than 4 per cent for those aged 40 and over. By comparison, men's unemployment rates ranged from 14 per cent for those aged 16-24 to a lowest rate of 5 per cent for the 40-49 age group. By age of youngest dependent child, women with children aged under five had the highest unemployment rate (9 per cent) and those with children aged 11-15 or 16-18 had the lowest rates (4 per cent and 3 per cent respectively). While this

Feature

is partly an age effect, among young women with children the unemployment rate rises to 24 per cent, more than double the rate for those without children

Unemployment rates (as a percentage of economically active) can be calculated for married and nonmarried men (4 per cent and 13 per cent) and women (3 per cent and 9 per cent) from Table B. The rate for nonmarried women with dependent children (16 per cent) is higher than that for non-married women without dependent children (7 per cent). At least some of these differences are due to the different age distributions of these categories.

One reason why women have lower unemployment rates than men is that they remain unemployed for shorter periods. Table L shows that 42 per cent of all women who were ILO unemployed in spring 1998 had been out of work and looking for a job for less than three months, compared with 29 per cent of men. Conversely, 24 per cent had been unemployed for one year or more. compared with 38 per cent of all men.

The routes into unemployment tend to differ between women and men. Only a third of unemployed women go straight from being employed to unemployed, compared with two-thirds of men. Women are much more likely than men to have been looking after their family/home before re-entering the labour market as unemployed. In all, 59 per cent of unemployed

women with dependent children were looking specifically for part-time work in spring 1998, compared with 32 per cent of women without dependent children and only 8 per cent of men (Table M).

Inactivity

Economic inactivity is defined as neither working nor ILO unemployed - those who are seeking work and are available to start (see technical note for full definition). Trends of economic inactivity rates mirror those

Unemployment rates by age of youngest dependent child and age, people of working age; United Kingdom; spring 1998 (not seasonally adjusted)

Less than 10.000; sample size too small for reliable estimate See Tables C and D

of activity rates. Just as the activity rates for women have risen fastest among women whose youngest dependent child is aged under five (see Table C and section above on labour market participation), so the inactivity rate has fallen furthest among this group.

Table N shows the reasons given by respondents for their not seeking or being available for work and whether they would like a job. Clearly, such questions (described in the technical note) are open to a variety of interpretations which affect the way they are answered. For example, a woman with a young child may take into account the difficulty of arranging

childcare in deciding whether to say that she would like to work and therefore say "no", but another in similar circumstances might ignore this possible problem and answer that she would like to work. Around a quarter of inactive women without children say they would like work compared with about one-third of women with dependent children and a similar proportion of inactive men. Of the remainder among women without dependent children, and men, the most common reason why respondents are inactive is that they are either students or long-term sick/disabled. Not surprisingly, the vast majority of women with dependent children who

Feature

do not want a job say this is because they are looking after their family or home. The age of youngest dependent child has little effect on the reasons given for different types of inactivity.

Conclusion

Women, particularly those with young children, have increased their labour market participation over the last decade. The increase has been concentrated among women with higher qualifications and in professional and managerial occupations, but both full-time and part-time working have increased.

Notes

Emerging findings from a study for the Employment Service show that, in many respects, cohabiting mothers resemble lone mothers more closely than they do married mothers

- Research by Heather Joshi et al. into the experiences of women born in 1958 found that women who had been teenage mothers were less well 2 educated and more likely to be lone parents. On the other hand, women who delayed their childbearing were generally better able to take advantage of improvements in employment conditions (ESRC 1998).
- See Social Trends 29, Table 4.7, TSO, 1999 and for more analyses of the characteristics of lone mothers, see 'Lone parents and the labour market', 3 Employment Gazette, November 1992; 'Working parents: trends in the 1980s', Employment Gazette, October 1994; 'Mothers in the labour market', Employment Gazette, November 1994.
- Reuben Ford in Childcare in the Balance, Policy Studies Institute, 1996 found that more than one-third of out-of-work lone parents say that the cost of childcare constrains them from taking up work of 16 or more hours each week, and 13 per cent say it is not the cost but the availability of childcare that is the main problem.

Technical note

The Labour Force Survey

The LFS is a quarterly sample survey of around 60,000 households and people living in NHS accommodation (i.e. nurses). Between 1984 and 1991 the survey was carried out annually, with results published relating to the March to May quarter. Prior to this the survey was conducted every two years, but not until 1984 did the questionnaire stabilise in a form similar to that used at present.

The questionnaire covers a wide range of demographic and employment-related information. Questions about economic activity - paid work, job search, etc. – are asked of all people aged 16 or over, and relate to a specified reference period mmediately prior to the interview (normally one week or four weeks, depending on the topic). If any household member is unavailable for interview, information for that person can be provided by a related adult member of the same household. Students living away from home in halls of residence are included.

Economic activity classification

People in employment are those aged 16 and over who did some paid work in the reference week (whether as an employee or self-employed), those who had a job from which hey were temporarily away (on holiday, for example), those on government employment or training programmes and npaid family workers

Unemployed people (based on the internationally ecognised ILO measure of unemployment, also used by the DECD) are those aged 16 and over without a paid job who aid they were available to start work in the next two weeks nd who either had looked for work at some time during the our weeks prior to the interview or were waiting to start a ob they had already obtained.

The economically active population, or labour force, omprises people in employment together with unemployed eople. The economically inactive population comprises people who are neither in employment nor unemployed. This group cludes all people aged under 16 together with those who re, for example, looking after a home or retired, and also iscouraged workers who are not seeking work because they elieve there are no jobs available.

There are several questions asked to determine whether a espondent is economically inactive and, if so, their main eason for inactivity

If the respondent is not employed they are asked whether hey were looking for work in the previous four weeks. If respondents answer "no" and also have not been seeking a place on a government scheme in the last four weeks they will be classified as economically inactive. They are then asked whether they would "like to have a regular paid job at the moment, either a full-time or part-time job?" If respondents answer that they would like a job, they are then asked to give the main reason why they had not looked for work (and the answer is recorded as their main reason for inactivity):

assessed by a training agent 2 Student

- 3 Looking after the family/home
- 4 Temporarily sick or injured
- 5 Long-term sick or disabled
- 6 Believes no jobs available

7 Not yet started looking 8 Any other reason

Those who replied earlier that they did not want a job are asked the main reason that they did not want work (in the last four weeks) to record their main reason for inactivity:

- assessed by a training agent
- 2 Student 3 Looking after the family/home
- 4 Temporarily sick or injured
- 5 Long-term sick or disabled
- 6 Doesn't need employment
- 7 Retired from paid work 8 Any other reason

Those who had been looking for work (and those who have already been identified as inactive because they are not seeking work, but who would like a job) are asked a further question about their availability to start work:

"If a job or a place on a government scheme had been available in the week ending Sunday the [date], would you have been able to start within two weeks?'

Those who had been seeking work, but were not available to start work, are then defined as inactive. All those responding that they are unavailable to start work are then asked to state the main reason:

weeks?"

- 2 Looking after family/home
- 3 Temporarily sick or injured
- 4 Long-term sick or disabled
- 5 Other reason

For those who had been seeking work the answer to this question is used as the main reason for their inactivity. The reason for inactivity for those who had not been seeking work is already defined by the answer to the question about why they were not seeking.

As with any sample survey, estimates are subject to sampling variability. In general, the larger the group, the more precise (proportionately) is the LFS estimate. Estimates of fewer than 10,000 people (after grossing up) are not shown in published analyses of LFS results since they are based on small samples (less than about 30 people) and therefore are likely

a Includes those who did not state whether they worked full- or part-time. From 1989, this group included all those on government-supported training and employment programmes, while from 1985 to 1988 it involved those on the Youth Training Scheme at a college or training centre (or temporarily away), and from spring 1992 also includes unpaid family workers. b Includes respondents on government-supported training and employment programmes up to 1988 (but see also footnotes above for 1985-88). c Classification based on respondents' self-assessment.

Includes those who did not state whether they worked full- or part-time, permanent or temporary.
 Unpaid family workers have been classified as in employment since spring 1992; prior to this some may have been reported as employees or self-employed, others as unemployed or inactive.

Table C

Spring 1988

All persons

Inactive

Includes those who did not state if they worked full-or part-time, or their employment status. Classifications are based on respondents' self-assessment. Excludes most unpaid family workers prior to spring 1993 although some may have been reported as employees or self-employed. Unpaid family workers have been classified as in employment since spring 1993.

a There are some small discontinuities in the classification between 'higher' and 'other' between 1991 and 1998; see note 1 in text.
b Includes those who did not state highest qualification.
c 'Higher' qualifications are those above GCE A-level or equivalent.
d 'Other' qualifications are those of GCE A-level or equivalent or lower and includes miscellaneous qualifications which cannot be classified.

Less than 10,000 in cell: sample size too small for reliable estimate. The occupation classification used in this article is the Standard Occupational Classification (SOC).

Includes those who did not state whether they worked full- or part-time. The full/part-time classification is based on respondents' self-assessment.

Less than 10,000 in cell: sample size too small for reliable estimate.

The industrial classification used in this article is the Standard Industrial Classification (SIC92), and is based on respondents' self-assessment.

Includes those who did not state whether they worked full- or part-time. The full/part-time classification is based on respondents' self-assessment.

Excludes industry divisions containing fewer than 30,000 women. Public/private sector split is based largely on respondents' self-assessment.

Pay structures of the low-paid and the national minimum wage

Key points

The national minimum wage NMW) includes only 'standard pay', efined as basic pay and any paynents based on output, productivity r performance. All other premium ayments, special allowances, pay upplements and benefits are excludd from the NMW (except in the ase of free accommodation provided by the employer).

A comparison of some other ountries' minimum wage definitions hows that none use a total earnings pproach - the composition of the age varies according to each couny's individual labour market condions and pay practices.

Research by the Low Pay ommission shows that while, in eneral, pay structures in the UK ay be complex, for the low-paid ey tend to be relatively simple.

The most important addition to sic pay is overtime. But there are portant differences in the compotion of pay in different industries here the low-paid tend to be conegated. For example, in clothing and textiles individual piecework systems are important, while in hospitality and hairdressing tips and ratuities are significant.

The national minimum wage comes into effect from April. A key aspect of the Low Pay Commission's deliberations concerned the definition of the wage, including which pay components should count towards compliance and which should not. This article explains the definition of the wage adopted and provides previously unpublished information on the structure of pay for low-paid workers.

Introduction

IN GENERAL, low-paid workers receive few additions, if any, to basic pay. In some business sectors, however, variable payments of a business-specific nature, premiums and benefits may form a significant part of a low-paid worker's wage. Hence, defining which components can count towards the national minimum wage (NMW) has important implications for both employers and workers in certain sectors. These implications include the number of workers who will be covered; the potential costs to employers; the ease with which the wage can be enforced; and the impact on an individual worker's overall earnings.

Feature

By Geoff White, Low Pay Commission Secretaria

The Low Pay Commission (LPC) therefore considered the issue of what should count towards the NMW very carefully. The question of how a minimum wage should be defined was a major priority in its work, as it sought a definition which would be simple and fair, easily enforceable, and consistent with the needs of business and the lowpaid. In broad terms, it recommended that, in whatever way workers' pay is defined or whatever hours they work, only 'standard' pay can count towards the NMW.² Any payment based on output, performance or productivity, including tips and gratuities paid through the payroll and piece rates, can count towards the wage but all other components, including benefits, are

2

excluded (except in the case of free accommodation).

The Government accepted the Commission's recommendations on the definition of the wage in full. Following consultation on the detail of implementation, the National Minimum Wage Regulations were laid in February 1999 and provide the specifics of how the NMW will operate and the requirements for employers. Detailed guidance on the law has also been published by the Department of Trade and Industry.

Defining the national minimum wage

The selection of which components should count for the NMW and which should not is by no means straightforward, and international practice varies. This section examines the definition of the national minimum wage adopted in the UK and the reasoning behind it. It also shows how the UK definition compares with international practice.

The UK definition

The definition adopted is set out in *Table 1*. In general terms, pay structures in the UK have become increasingly complex, and there are many elements to consider in defining the wage - a basic wage, bonuses, allowances and supplements, premium pay for working non-standard hours and profit-related pay, as well as a range of fringe benefits, including benefits-in-kind. Indeed, there is evidence that *some* employers are seeking to change the balance of guaranteed to variable pay, with increasing emphasis on 'at risk' pay-

ments based on different measures of performance - individual, group and organisational - instead of a basic wage.

Given the evidence presented and research on pay structures by the Commission, it seems that neither a basic rate nor total remuneration would be fair or workable. A definition based on a basic rate, as suggested by some employee organisations, would undermine many industries' existing remuneration practices, such as piecework in the clothing industry. On the other hand, total earnings would be unfair because workers might be forced, for example, to work long overtime hours or in abnormal and dangerous conditions to earn the basic minimum through premium pay or special allowances. A majority of those giving evidence suggested that overtime premiums should not be counted, while the Engineering Employers' Federation³ and the Business Services Association⁴ argued that shift premiums should also be excluded. The case for excluding 'non-standard' components is that such payments compensate for work in particular adverse conditions or are reimbursement for employee expenses and hence are designed to meet particular labour market needs

The evidence to the Commission expressed a variety of views on tips and gratuities. The British Hospitality Association argued that "all payments made under service charge and tronc⁵... be treated in the same way as normal wages".⁶ The National Hairdressers' Federation stated that: "Gratuities, unless collected and distributed by the employer ... should be excluded".⁷ The GMB argued that tips paid directly or via the tronc system should not count towards the wage, but payments to workers in respect of a service charge added (voluntarily or not) by customers paying their restaurant bills by cheque or credit card could be counted.8 Under the Wages Councils, tips paid directly to a worker by a customer could not count towards the minimum rate, but tips added to the bill which were paid by cheque or credit card belonged to the employer and could be used towards meeting the wage. The Commission concluded that payments through the payroll should count towards the NMW, provided they are for standard work or hours.

A final element is the treatment of benefits, such as the provision of free accommodation, board and lodging company discounts, subsidised meals vouchers or employer contributions to occupational pension schemes. These are important to employees in certain industrial sectors. But it is difficult to estimate and monitor the value of man of these benefits. For example, the value of individual pension contributions cannot be calculated easily in each pay reference period and the attribution of individual contributions would be difficult to trace. In the case of other benefits, such as staff discounts on products or services, it is not clear whether an individual employee is or is not taking advantage of the offers. The criteria of simplicity and enforceability suggest that the value of benefits is generally not included within the definition of the national minimum wage.

The one exception to the exclusion of benefits is the inclusion of free accommodation, subject to a maximum offset (the regulations stipulate that a maximum of £19.95 per week is allowable against the weekly NMW - see Table 1). This recommendation was based on arguments from employers in the industry and the major union concerned. The GMB stated that: "In certain sectors, accommodation is an integral part of the employment relationship ... If some allowance is not made for this in the national minimum wage legislation, GMB is concerned that some employers might introduce high rents." Despite this

exception to its overall view on benefits, however, the Commission stated that it believed "that workers should ideally be remunerated in money, not in kind, and should be able to earn enough to pay rent". For this reason, the Commission is particularly concerned to monitor the operation of this offset with a view to its phasing out in the longer term.

International practice

As demonstrated above, the definition of the NMW is a hybrid which includes some pay components but excludes others. While most economic studies of the effects of minimum wages in different countries assume that total earnings equate to the minimum wage, in fact virtually no country includes all remuneration components in the definition of what counts towards the minimum wage. As *Table 2* shows, most minimum wage systems studied by the LPC use a hybrid definition that includes some components but not others.

There are limitations to the lessons that may be drawn from other countries' definitions of the minimum wage.9 Pay systems and practices vary significantly between countries - for example, not all countries operate profit-related pay schemes or individual merit pay. In some countries incentive pay is common, while in others it is less significant. The employee benefits provided may also differ according to whether they are provided by the state or the employer. In some countries the detail of what pay components an employer must provide is laid down in law - for example, minimum overtime premiums may be stipulated, as well as a minimum wage (e.g. in France). In some countries there may be bargaining over what counts towards the minimum wage between employers and trade unions at sectoral or company level (e.g. in Canada, New Zealand and Belgium). Minimum wage systems are designed for different labour markets and employment conditions and so simple comparisons are difficult.

Table 2	inimum wage definitions in other countries
Country	Definition of the national minimum wage
Belgium	Basic 'core minimum salary', excluding all other premiums, bonuses and allowances. Different arrangements can be negotiated at either sectoral or company level.
Canada	Basic wage. Varies according to province (legislation usually covers gratuities, call-in pay and deductions).
France	Earnings, including bonuses, tips and commission, and accommodation and meals bu excluding profit sharing bonuses, overtime, weekend working, and night working premiums and other compensatory payments.
Greece	Minimum wage excludes overtime hours and commission.
Japan	Minimum wage excludes bonuses, overtime, holiday pay and night working payments
Netherlands	Earnings, including holiday, meals and housing allowances, but excluding all additiona overtime and shift premiums, bonuses and other compensatory payments.
New Zealand	Minimum rate can include piecework but not merit bonuses, tips or gratuities. The inclusion or exclusion of all other additional payments (such as premiums, allowances and supplements) within the minimum wage is decided by the parties to the employment contract. Deductions can be made for board or lodging up to a maximum figure.
Portugal	Minimum wage does not include any premiums, bonuses, or other allowances, except commission and specific gratuities. It can include the value of any food and lodging provided.
Spain	Basic amount, including piece work earnings, to which all other payments must be added. Overtime, shift and unsociable hours premiums, profit shares, and all allowances (except sick pay, holiday pay and maternity pay) are excluded.
USA	A specific hourly amount, including incentive pay, tips and accommodation and meals, but excluding overtime, shift or unsociable hours premiums, and all other allowances.

Table Components of the national	minimum wage
Components included	Components excluded
Basic pay	All premium pay (e.g. overtime and shift premiums special allowances and pay supplements.
All payments based on output, productivity and performance, including bonuses, PRP and tips and gratuities paid through the payroll.	All benefits, including benefits-in-kind, except accommodation (see left-hand column). Tips paid directly by customers to staff.

Accommodation up to a maximum of £19.95 per week.^a

Feature

Annual Province Include 1000 Pay structures of the low-paid

A general pattern can be discerned, nevertheless. Most countries have adopted a 'basic rate plus' definition which often includes incentive pay but excludes premium pay, supplements and allowances and most benefits. In Japan, however, bonuses are excluded and in Canada the minimum wage is defined as a basic rate of pay (but the definition may be varied at provincial level through negotiation). In France and the USA tips can be included, whereas in New Zealand they are specifically excluded. In Portugal, France, New Zealand and the USA the value of free accommodation and meals can be included.

Pay structures of the low-paid

The LPC carried out extensive research on pay systems and structures, both from a general perspective and from the particular perspective of lowpaid workers. It considered the available statistical data on pay structures for the low-paid and also remuneration practices in particular sectors where the low-paid are congregated (e.g. hospitality, clothing manufacture, and retailing). The written evidence submitted to the Commission and the oral evidence sessions also gave it the opportunity to gain additional insights into the issues involved.

This section presents data on the components of low pay drawn from the latest New Earnings Survey (NES) from April 1998. The key points on the components of pay are the same as for the 1997 survey, which was the latest available NES at the time the Commission made its recommendations. The figures in this section are given for those with hourly earnings both above and below £3.50 – roughly the April 1998 equivalent of the recommended full NMW of £3.60 at April 1999.

The overall finding of this work was that, while pay structures in general can be complex and consist of many separate components, there are significant variations between industries and occupations. Some industries are noted

a The amount that can be deducted is the lesser of either: (a) 50 pence for each hour worked reduced in proportion to the number of days for which living accommodation is provided; or (b) £2.85 for each day of living accommodation, i.e. £19.95 per week for seven days living accommodation.

for the complexity of their pay while others have relatively simple structures. Few of the low-paid, however, have elaborate pay structures and most receive little in the way of additional pay components on top of their basic pay. Moreover, female and part-time employees - the majority of those directly affected by the NMW - are less likely to have access to additional payments such as overtime and shift premiums, incentive bonus schemes and special work-related allowances (see Figure 1). In general, pay struc-

tures become more complex at higher levels of income or where collective agreements exist.

Such additions to basic pay can. however, be important for those lowpaid workers actually receiving them. Figure 2 shows the proportion of lowpaid employees receiving identifiable pay additions alongside the average contribution that each component makes to total earnings. As can be seen, overtime is by far the most important pay addition for the lowpaid. This is not altogether surprising as many low-paid workers will work additional hours in order to supplement their basic income. Of those earning less than £3.50 per hour in April 1998. around one in six received overtime pay.¹⁰ For those low-paid employees working paid overtime, earnings accumulated during these extra hours amount to over 30 per cent of total earnings among part-time employees and 16 per cent for those working fulltime

ees in receipt of the other identifiable components - shift pay, profit-related pay and other incentive pay - is small. For those who do receive them, however, these components make up over 10 per cent of total earnings.

Variations by industry

ple in particular sectors of employment has an important influence upon the composition of pay for these workers: there are significant variations by industry in the composition of earnings (see Figure 3).

ees in the retail industries receive overtime payments. Further analyses reveal that, on average, overtime pay makes up almost a third of total earnings for these employees. Incentive pay provides an important component in the clothing industry - payments by results are paid to more than 10 per cent of low-paid employees in clothing manufacture and such payments make up around a quarter of all earnings for those in receipt of them. Indeed, industry sources suggest that actual levels are even higher than the NES figures indicate, as most employees are working on piecework systems. Incentive pay i also important to hairdressers, which may be indicative of tips paid through the payroll or commission. Generally, shift pay and profit-related pay are less important in low-paying industries, but where they are paid they can be signifi-

There is also a degree of variation within industries. Figure 4 shows that overtime is more common among lowpaid employees in 'non-specialised stores' (such as supermarkets) than in other retailing. By contrast, incentive

cant components in overall earnings.

Low-paid employees in receipt of overtime and incentive payments in selected

Source: New Earnings Survey

pay is most prevalent among employees selling household items, such as furniture and white goods. While overtime is important in canteens and catering, few employees in other branches of the hospitality industry receive such payments.

It is also important to note that the NES data, being a survey conducted in April, may miss seasonal fluctuations. For example, overtime payments in agriculture and hospitality are likely to increase in the summer.

Employee benefits

The NES provides valuable data on the composition of pay for the lowpaid, but total remuneration consists of more than pay. It also includes other items (such as company transport, pension schemes, life assurance and private medical insurance) and benefitsin-kind (such as board and lodging, free meals and staff vouchers). The value of these benefits to the low-paid is difficult to measure by government statistics and there is little empirical

information on the spread of such items among the low-paid. Only in the case of pensions are there some statistics, which demonstrate the low prevalence of occupational pension schemes among low-paid workers.11 It is known, however, that certain benefits are more common among the low-paid than others. For example, in the hospitality industry and the voluntary sector free meals and accommodation may be provided to employees. The Agriculture Wages Boards for England and Wales and Northern Ireland already set maximum deductions for accommodation, meals, and board and lodging.

Monitoring and evaluation

The definition is a significant element in the process of ensuring the NMW is paid. Employers and workers will need to be quite clear about what earnings can be included in the NMW and what cannot. Employers will also need to keep records to be able to demonstrate to workers that they have paid the minimum wage. Under the Act, employees have a right to access to these records. The National Minimum Wage Regulations and the Guidance produced by the DTI set down what is required in these areas.

The Government has asked the LPC to monitor and evaluate the introduction and impact of the NMW.12 As part of that process it is keen to discover if there are any effects of its definition on existing pay structures.

In all sectors it is interested to know whether there is a shift in the balance of benefits to pay, or changes in overtime and shift premiums, as employers seek to pay the NMW by reprofiling the total reward package.

The LPC is also particularly keen to know what effects, if any, the definition will have in the hospitality industry, retail, the clothing and footwear industries, business services, health and social services, the voluntary sector and in hairdressing. In clothing and footwear, it is interested in whether there are changes in incentive payment systems as employers seek to accom-

March 1999 Labour Market trends 133

Anniy Dirinner

modate the new minimum wage level within the national agreements. In hospitality, it wants to see how the accommodation offset works and how employers treat the issue of tips and gratuities. In retail, it is interested to see whether there are changes in annual bonuses, profit-sharing schemes, commission and staff discounts as a result of the NMW.

The sources for this information will vary. The LPC secretariat will be analysing data from both the NES and the Labour Force Survey to detect any changes in the overall composition of pay as a result of the minimum wage, but there will also be a need for microeconomic studies at the level of the industrial sector or organisation. The Commission is keen to hear from any

organisations that are planning change in their payment systems and structure as a result of the NMW and also from those conducting research on particula sectors or industries. Information about research on the NMW can be forwarde to: Geoff White, Low Pay Commission Fifth Floor, 151 Buckingham Palac Road, London SW1W 9SS, e-mail geoff.white@lowpay.gov.uk.

Technical note

Data

The charts in this article use data from the 1998 New Earnings Survey (NES), which separates gross earnings into five principal components - overtime pay, earnings from Inland Revenue approved profit-sharing cash schemes, incentive payments, shift premium payments and the remainder. Incentive payments can include piecework, commission, productivity and other incentive bonuses.

The NES does not separately identify any other pay components, such as regional or standby and on-call allowances, which are to be excluded from the calculation of earnings for minimum wage purposes. Nor is it possible to disaggregate overtime pay into premium and non-premium elements. Some employees may in fact receive an overtime rate that is less than their basic rate. This has important implications for implementation of the minimum wage and will be examined in more detail in a forthcoming LPC research paper.

There is also some doubt as to what extent payroll records of components directly match those on the NES questionnaire. For example, the NES estimate of employees in receipt of incentive payments (including piecework) in the textile manufacturing industry is significantly below the industry's own figures for piecework.

In any case, the NES misses a large proportion of low-paid work through systematic undersampling of those earning below the PAYE tax threshold (see 'Towards reconciliation of NES and LFS earnings data', Labour Market Trends, May 1998, pp223-31). Such employees are almost solely part-time employees who are generally less likely to be in receipt of additions to basic pay. Hence the overall NES estimate of employees in receipt of all additions can be considered an upper bound.

For the purposes of this article employees are split into two groups: those with hourly earnings below £3.50 - the 1998 equivalent of the recommended full national minimum wage of £3.60 – and those above. All analyses in this article relate to employees on all rates of pay aged 16 or over. The minimum wage will not, however, apply to employees under 18 and there will be a development rate of £3.00 for those

a new job with a new employer.

Numbers affected

Latest ONS estimates suggest that around 1.9 million employees earned less than the minimum wage at 1998 prices. However, this calculation is based on combining data from the NES and the Labour Force Survey which do not disaggregate earnings components. Hence, this method may understate the number of employees likely to be directly affected.

The extent to which the definition of the minimum wage will change the numbers directly affected by the legislation will depend on how far employers consolidate existing premiums and other additional payments into basic rates. A rough estimate of the effect can, however, be gauged by comparing two distributions from the NES: first, the distribution of total earnings comprising all components; and second, the distribution of earnings excluding overtime pay and shift premium. It is then possible to look at the proportion of employees whose total earnings fall below the recommended minimum wage and then determine the earnings level on the second distribution below which an identical proportion of employees fall.

The NMW regulations

The regulations made under the National Minimum Wage Act 1998 prescribe the more detailed legislative requirements relating to the NMW. They set out what amounts or benefits can be included as part of a worker's remuneration for NMW purposes and those that must be excluded, as well as how deductions from pay, charges or expenses borne by the worker are to be treated - some may be counted towards the NMW.

aged 18-21. There will also be a development rate of £3.20 for employees aged 22 or over receiving accredited training in

Feature

This approach suggests that the monetary difference between the two distributions is no more than five pence. Even this can be considered high through exclusion of employees not in receipt of additional payments from the NES. Thus the earnings distribution can be considered a valid guide to the numbers directly affected by the minimum wage.

Annual Employment Survey 1997

By James Partington and Charles Mayell, Earnings and Employment Division, Office for National Statistics

Key points

The estimate of employee jobs in Great Britain for September 1997 is 2,846,200.

Employee jobs rose by 577,500 etween the 1996 and 1997 Annual mployment Survey (AES).

In September 1997, 50.9 per cent f total employee jobs were held by nen and 49.1 per cent by women.

Some 45 per cent of employee obs held by women were part-time, ompared with 12 per cent of mployee jobs held by men.

Some 75 per cent of all employee bs were in the service sector, 18 er cent were in manufacturing and 3 per cent in construction. The emainder were in the agriculture ind energy sectors.

The revision of AES 95 created a tep' in the employee jobs time ries which can be corrected using set of scaling factors.

• The new Annual Business Inquiry (ABI) is being validated against a subset of AES 97, and a decision will be taken in April on whether the ABI will replace the AES for 1998.

This article presents the results of the Annual Employment Survey 1997 and considers some of the themes that have emerged since the first survey in 1995. A subset of the 1997 results is being used to validate the methodology for the new Annual Business Inquiry, which may supersede the AES in 1998. The AES survey style and estimation methodology is assessed here to allow a comparison with the ABI, which is explained in the accompanying technical report.

Introduction

THE Annual Employment Survey (AES), which began in 1995, replaced the Census of Employment, which was last carried out in 1993. A biennial Sample Census had run from 1987 until 1993. The AES uses a smaller sample size in order to be more cost-efficient and timely than the Sample Census. Data collected from the sampled workplaces via AES questionnaires are fed into an estimation process that enables results to be produced for the whole business population (for more details, see the technical note). The results take the form of aggregate statistics, analysed by geography and industry, but are also a rich dataset from which many other small area analyses, cus-tomised to need, can be derived. The dataset is available on-line

Feature

from Nomis[®] and the AES 97 data should be loaded by the end of April 1999.

The AES results are used as a benchmark for the smaller short-term employment series (known as employee jobs) which measures monthly/ quarterly 'movements' (by region and industry) between the benchmark dates.

Growth in employee jobs over time

The AES was not designed as the main vehicle for measuring movements in employee jobs over time, but it is inevitable that users will compare the three surveys that have been conducted since 1995. When this is done the AES shows a rise of 403,300 between 1995 and 1996, and a further rise of 577,500 from 1996 to 1997.

is the principal source of data on movement over time because it measures monthly and quarterly changes in employee jobs via its own distinct sample of businesses. The short-term survey is, however, annually benchmarked against the September AES datum point. The September 1997 benchmark was published in the December 1998 labour market statistics First Release. Since then, data for the agriculture sector – which are not part of the AES but are provided by the Ministry of Agriculture, Fisheries and Food (MAFF) and the Scottish Office - have been reviewed. The techniques used to generate quarterly agriculture data from the single annual June snapshot provided by MAFF have been im-proved. Quarterly movements are now taken from the Labour Force Survey (LFS), replacing the factors that were derived from much older surveys. Users will therefore see revisions to the estimates for the agriculture sector (and also the whole economy).

The short-term employee jobs series

One of the themes that has emerged since the birth of the AES in 1995 has been a growing concern to achieve a better reconciliation between the way that different statistical series measure the labour market. One aspect of this is the relationship between the statistical outputs of the LFS and the AES.¹ The revisions to AES 95 and AES 96 (published in July 1998) made a significant contribution to the reconciliation project by bringing the two series into better alignment.² The methodological lessons learned in the redefinition of the AES total population in 1995/96 have been carried over into the AES 97 estimation process. As it now stands, the AES measures growth in 1996/97 as 577,500 compared with an LFS measure of 554,000 over the same period. This is well within the sampling variability of both these surveys.

The revision to AES 95 has also, however, had the effect of creating a 'step' in the time-series, i.e. between Census 93 and AES 95 (revised). The implications of this, along with how data users can maintain a consistent time-series, are explained in the technical note.

AES 97 key findings

Table 1 shows the number of employee jobs by industry held by men and women and whether the jobs were full-time or part-time. In September 1997 there were 22,846,200 employee jobs. Of these, only slightly more were held by men (50.9 per cent) than by women (49.1 per cent). However, Figure 1 shows the asymmetry in the sex profile of employee jobs when

analysed by full-time/part-time status. Some 55 per cent of employee jobs filled by women were full-time and 45 per cent were part-time. The profile for men is much more heavily weighted towards full-time jobs (88 per cent). Table 1 analyses employee jobs in

nine sectors called broad industry groups, using the Standard Industrial Classification (SIC). Figure 2 shows that the single largest industry group is public administration, education and health. The 'service sector' as a whole accounts for 75 per cent of all employee jobs, compared with 18 per cent in the manufacturing industries. The energy and water supply industries are the smallest individual industry group.

Table 2 shows where the employee jobs were located, according to Government Office Regions (GORs) London and the South East combined had 29 per cent of total employee jobs in Great Britain. These two regions had 33 per cent of total jobs in the service industry sector, as a whole, in Grea Britain. The largest number of jobs i a single GOR in agriculture were the South East, closely followed by Eastern and the South West. Scotland had 19 per cent of the jobs in the energy and water sector in Great Britain as a whole, followed by the South East, which had 12 per cent of Great Britain jobs in that industry. The West Midlands had the largest share o manufacturing jobs in Great Britain (13 per cent), with the North West a its closest rival (11.3 per cent). The South East had the largest absolute number of construction jobs, although this industry group was relatively evenly distributed across a number of other regions throughout Great Britain.

Employee jobs by industry 1995 to 1997

The majority of the agricultural data are not derived from the AES survey forms but from data provided by MAFF and Scottish Office and are not discussed here.

AES employee jobs in energy and water fell by 2.3 per cent between AES 95 and AES 96, and by a further 3.5

per cent between 1996 and 1997. This ector has become increasingly difficult to measure as the large utility companies merge their activities.

AES employee jobs in manufacuring rose by 65,400 (2 per cent) etween AES 95 and AES 96 and emained more or less steady up to 997. The big picture conceals some arger variations within the sector as a hole. The manufacture of textiles, for xample, shows a rise of 3 per cent etween AES 95 and 96; but a fall of 7 er cent between AES 96 and 97. The 996-97 period also saw substantial ercentage falls in tanning and dressing leather (16.5 per cent) and coke, fined petroleum products etc (13 per ent). The manufacture of food roducts and beverages, which rose by per cent (27,500 employees), and miture and other manufacturing not sewhere classified, which rose by 5 er cent (9,000 employees), were nong the factors that held the sector back from an overall decline.

AES employee jobs in construction fell by 3 per cent between 1995 and 1996 but rose by 15 per cent between 1996 and 1997. Other sources confirm that after June 1997 the rise in conruction employment coincided with a mparable fall in self-employment. he effect is more apparent than real nd is due to revised guidance from the Inland Revenue on the status of subcontractors.

The distribution, hotels and restaurants and transport and communications groups, in tune with most of the service sector, have maintained rises over the three-year period. The distribution sector rose by 3 per cent in both 1995-96 and 1996-97; the transport sector maintained increases of 1 per cent over the same period.

The 6 per cent rise between 1996 and 1997 in the banking and finance sector equates to more than 250,000 employees but, while the service sector has been stronger than manufacturing in all sources, this change is not an entirely real effect. Much of the increase is within the recruitment agencies section (SIC 74500) and this is, in turn, due to a clarification of the guidance on how to collect these data. In general, recruitment agencies should

record their temporary employees at the base from which they are paid and not at the site at which they are working on the survey date. The clarification of this rule has exposed a number of cases where agencies did not report this way in earlier years. This helps to explain the larger than expected increase in this sector between 1996 and 1997.

More than half of the 102,000 rise in public administration, education and health between 1995 and 1996 was offset by the fall of 63,000 between 1996 and 1997. These changes reflect the difficulty that the AES has experienced in maintaining a consistent definition of the public sector in the face of the kind of structural changes that have taken place in the health service.

Other services saw a 6 per cent rise between 1995 and 1996 but a 1.5 per cent fall in the year to 1997.

Employee jobs by region

Table 2 shows the number of employee jobs for each industry by Government Office Region (GOR), and *Table 3* breaks down the employee jobs into male/female/full-time/parttime employee jobs by county and unitary authority. All GORs in England

Feature

Annual Employment Survey 199

showed a rise in employee jobs between AES 96 and AES 97. The largest absolute rises were in London (up by 126,600), Eastern (97,300) and the South East (92,900). The largest percentage increases were in Eastern (up by 5 per cent) and the South West (4.3 per cent). These increases are largely explained by the buoyancy of business services as an industrial sector

Employee jobs fell in Scotland by 20,400 (1 per cent) between 1996 and 1997 and by 1,100 (0.1 per cent) in Wales.

Integrating the agriculture data with the rest of the AES dataset has proved a recurring difficulty within AES since its inception in 1995. For example, the AES 95 and 96 datasets (as loaded on Nomis®) contain no agricultural data at district level, although it is present at higher levels of geographical aggregation. The difficulty has generally arisen from the way in which MAFF suppresses data in order to protect against the potential disclosure of the identity of particular businesses in this sector. In AES 97 similar problems have prevented the release of subregional agricultural data. Table 3, therefore, does not include agriculture data but the overall size of the agricultural sector in each GOR is given in Table 2. It is suggested that

customers who seek greater definition of the sub-regional data for agriculture should approach either MAFF or the Scottish Office.

The future of the AES

The new Annual Business Inquiry (ABI) is being validated against a subset of AES 97. The extent to which the 1997 ABI-derived data are judged to have passed various tests of statistical integrity will inform a decision on whether to publish the results derived via the AES 98 methodology or via ABI 98. That decision cannot be taken until April 1999 because the ABI 97 small area

results were not fully finalised until March. AES 98 is, therefore, being run in concert with the ABI to provide distinct (but partly overlapping) datasets which will be processed via the AES and ABI methodologies respectively. For more details, see the technical report on the ABI on pp149-52 of this issue.

The AES 97 results are not being printed in booklet format but disseminated via electronic media or hard copy tables customised to users' needs Please telephone your data requirement to the AES Helpline on 01928 792690.

Technical note

The survey Data collected

Employers in the sampled group were required to make a return for the number of employees in their employment on 12 September 1997. The return distinguishes between men and women and between full-time and part-time workers (the latter being defined as those normally employed for up to 30 hours a week).

The total number of employee jobs should include: those temporarily absent at the survey date because of sickness, holidays, short-time or other stoppages (regardless of whether the employees affected were being paid); employees who did not work on the survey date but who are regularly employed on other days (e.g. part-time and week-end workers); those employed away from the workplace (e.g. sales representatives, transport workers).

The total number should exclude: self-employed; working proprietors; partners; directors not under contract of service; people working in their own homes on piecework; domestic staff working in private households; members of the armed forces; employees still on the payroll as pensioners; trainees who do not have employee status; those employed by outside contractors or agencies; people under 16 years of age; workers covered by the Agricultural Census.

The business description is processed, using optical character recognition technology allied to a piece of software called Precision Data Coder, to provide an industrial classification of the business under SIC 92.

The postcode is the means by which the results process assigns employees in local units to wards. These ward totals are then aggregated to form all the various other geographies.

As the AES results are aggregated at ward level, employers are required to make their returns in respect of employees at each individual workplace (i.e. local unit). Where employers have more than one distinct business activity at a single location, the workplace should be classified to the principal activity taking place at the site.

Method

The AES is a statutory postal inquiry conducted in Great Britain under the Statistics of Trade Act 1947. Section 1 of the Act creates an obligation on contributors to provide information necessary for the appreciation of economic trends and the provision of a statistical service for industry and for the discharge by government departments of their functions'.

Survey forms are sent to the address held on the Inter-Departmental Business Register (IDBR) which is identified as the address where an employer held pay details for a particular part of the business (known as the reporting unit). Where employers have supplied information, such as their business description, in an earlier survey, this information is pre-printed on their AES form. Non-response is followed up by reminder letters, which include information about possible enforcement action.

Each unit for which a separate return is made is known as a local unit (LU). Most LUs will represent an entire factory, office or shop and will include all employees working there. Occasionally there will be two or more LUs at the same address, reflecting either split PAYE arrangements (e.g. separate schemes for weekly and monthly paid staff) or that there is more than one

correct return.

The AES 97 response rate was 90.4 per cent, compared with a target response rate of 92 per cent.

Samble

The sample was drawn from the IDBR, which was created as a result of an agreement reached in 1992 between the former Central Statistical Office and Employment Department to create a register of businesses from VAT and PAYE administrative sources.

The AES 97 sample comprised 105,000 enterprises. An enterprise is roughly defined as a combination of local units (i.e. individual workplaces with PAYE schemes or registered for VAT) under common ownership. These enterprises covered roughly 0.5 million local units and 15.5 million employees (out of a total population of roughly 23 million employee jobs). The main sample for AES 97 was drawn in the July preceding the survey date in September 1997 and then topped up by a further sample of about 2,000 enterprises drawn in early October 1997. The primary intention of the 'top-up' is to survey a sample of enterprises operating on the survey date but not identified in administrative returns until after the main sample selection.

as follows:

- every year
- once every four years.
- every year

once every 25 years.

Methodology

The AES 97 collected employee jobs data for those enterprises in the sample, and estimates were derived for all enterprises not in the sample but present in the total population held on IDBR, and for enterprises that failed to respond to the survey questionnaire.

In general, a statistical technique known as linear regression was used in order to derive these estimates. This technique exploits the relationship between: (i) the employee jobs data collected for sampled enterprises in AES 97; and (ii) data from PAYE administrative sources, for those same enterprises, held on the IDBR. Values for (i) and (ii) were plotted for sampled enterprises of similar category and size-band. This plot allowed the construction of a line of best-fit which showed how surveyed employee jobs data related to PAYE-derived employment data for each category and size-band of enterprise. This relationship was expressed in co-efficients which were applied to the PAYEderived data for each non-sampled and non-responding enterprise, to arrive at the required estimates.

In July 1998 the AES 95 and 96 results were revised in order to take account of new research on how to gross the samplebased results of the AES to the overall population of businesses.

Annual Employment Survey 1997

Feature

Annual Employment Survey 199

distinct business activity carried out at the same address. A helpline was in operation to assist employers in making the

The frequency of inclusion in the sample for any enterprise is

• Multi-workplace enterprises with 25 or more employees -

• Multi-workplace enterprises with fewer than 25 employees -

• Single-workplace enterprises with 50 or more employees -

• Single-workplace enterprises with between 25 and 49 employees - once every four years.

Single-workplace enterprises with fewer than 25 employees –

Technical note

This research successfully challenged previous assumptions about the extent to which it was proper to include, in the total population, businesses on the IDBR that were registered only for VAT (as opposed to registered only for PAYE or registered for both VAT and PAYE). The effect of these changed assumptions on the original AES 96 results, for example, was to reduce the estimate of employee jobs in businesses registered only for PAYE by 0.2m; and to increase the estimate of employee jobs in businesses registered only for VAT by 0.6m. The methodology for grossing to the total population in AES 97 was consistent with that used for the revised AES 95 and 96 results.

The regression method of estimation could not be used for non-sampled/non-responding enterprises for which PAYE-derived data were not available. In these cases, therefore, each enterprise was given the average employment value of enterprises in the same category and size-band who had supplied an employment return to AES 97.

The local unit structure for non-sampled/non-respondent enterprises with multiple sites was assumed to be as held on the IDBR, as at March 1998. The variation between this date and the survey date was designed to compensate for time-lags in the process of up-dating the local unit structure on the IDBR. The employment breakdown (i.e. male/female/full-time/parttime) across local units for non-sampled/non-responding enterprises was imputed via what are known as decomposition factors. These decomposition factors were derived from the sampled/responding units. Tests of statistical significance were used to validate which variables (e.g. level of geographical aggregation, level of definition within broad industry group) provided the most reliable means of deriving decomposition factors.

Continuity in the employee jobs series

The starkest manifestation of the step in the time-series caused by the revision to AES 95 is seen in the total number of local units (i.e. workplaces) that employ between one and ten employees. Census 93 ostensibly counted 0.9 million such small workplaces in Great Britain, whereas the AES 95 (revised) estimate is 1.6 million. This does not express a genuine increase in small businesses but an improved methodological assumption about how to estimate this sector.

In response to requests from data customers, who wish to maintain consistent time-series, ONS has developed a set of scaling factors (see *Tables 4* and *5*). These factors can be used for

each region, county and district (available on request) as multipliers for the corresponding level of aggregation for 1993 data. The scaling factors can be used against pre-1993 data although users should realise that their reliability will be progressively degraded as they are applied to earlier years.

Readers will note that the scaling factors are quite small. This is a reflection of the fact that the large rise in the number of local units was not accompanied by a correspondingly large rise in the number of employee jobs.

As the short-term series is benchmarked on AES it follows that the step in the series mentioned above has introduced a similar discontinuity into the short-term employment series. This series traces comparable movements back to 1959. Consultation is currently in progress as how best to revise that series to remove the discontinuity.

Annual Business Inquiry 1998

By James Partington and Charles Mayell, Earnings and Employment Division, Office for National Statistics

Key points

• The Annual Business Inquiry (ABI) plans to achieve greater coherence between employment and proluctivity statistics and reduce the overall compliance costs for business.

Prepared by the Government Statistical Service

If the results of a parallel run are adged to be sound, the ABI results will be published instead of the Annual Employment Survey (AES) results for 1998. That decision will be taken in April 1999.

As the decision cannot be taken ntil April 1999, it has been necesary to run AES 98 and ABI 98 as to overlapping business surveys in the 1998 and early 1999.

ONS will establish a consultative oup, including officials from the Department for Education and Employment, the Department of Trade and Industry and local government, to quality assure the initial catistical products derived from the BI.

• Although the ABI and the AES differ in their sampling and estimation methods, the range of outputs (including small area results) will be at least as great under the ABI as under the AES.

This article introduces the planned Annual Business Inquiry and explains the steps being taken to protect the consistency of the employee jobs series when it supersedes the Annual Employment Survey.

Introduction

THE PLANNED change from the Annual Employment Survey (AES) to the Annual Business Inquiry (ABI) seeks to realise a number of themes that are important to ONS and its customers. One of the big ideas behind the ABI is the achievement of greater coherence between employee, output data and other economic business data, by using the same statistical sample for each. This common sampling frame will supersede the independent samples used by the AES and the former Annual Census of Production and Construction (ACOP/C). The AES and the ACOP/C duplicated the collection of some employee data the ABI will reconcile this on a single survey form, with obvious benefits in the

Technical report

reduction of overall compliance costs for businesses. The standardisation of sampling and data collection will be accompanied by a common statistical methodology to govern the estimation processes.

The ABI will also gather, under the same banner, the financial data that has hitherto been collected by the ACOP/C and the Annual Distribution and Services Inquiries (DSI). The ABI will, therefore, be a two-part survey. The ABI/1 survey form will collect employment data, while the ABI/2 form will collect the other economic data; all businesses selected for ABI will receive parts 1 and 2. This article deals only with ABI/1, which covers employment.

Annual Business Inquiry 1998

AES/ABI parallel run

The move from the AES to the ABI will be achieved over a three-year period. From the users' point of view, the 1997 survey year looks no different. An accompanying article in this issue describes the results (pp137-47). But in fact the 1997 survey year will be used to provide a parallel run of the existing methods against the proposed methods for the ABI. It will happen as follows.

AES 97 ran with a sample size of about 105,000 businesses. The Great Britain results for September 1997 were published in Labour Market Trends in January 1999, with the small area statistics available from 1 March 1999. These results were processed according to: (a) the methodology described in the article on AES 97; (b) taking advantage of the revised assumptions about how to gross to the total population as described in the July 1998 edition of Labour Market Trends.1

The ACOP/C 97 has been modified to collect data on the same basis as that which will be used for ABI. Those data can also be analysed via the ABI estimation methodology.

It follows, therefore, that a comparison of results from AES 97 and ACOP/C 97 can be used to simulate the outcome of a parallel run between the AES and the ABI, although not without some problems. Firstly, the simulation cannot extend to the 'whole economy' because of limitations in the scope of the ACOP/C. Secondly, an entirely level playing field would be one on which exactly the same businesses were captured within, for example, the manufacturing sector of AES 97 and the manufacturing sector of the ACOP/C survey. This will not be the case. Large businesses straddle even the broadest of industrial definitions and assigning SIC codes to such multidimensional businesses is always a compromise. The parallel run will, therefore, need to unpick and reassemble those businesses where the coding compromises have been made differently in the AES and the ACOP/C.

AES 98 v ABI 98

Various tests of statistical integrity have been devised. The extent to which the 1997 ABI-derived data, for given industrial sectors, are judged to have passed those tests will inform a decision on whether to publish the results derived via the AES 98 methodology or via ABI 98. That decision cannot be taken until April because the ABI 97 small area results were not fully finalised until March. Measures of the precision of the estimates, such as sampling errors, will accompany the published results.

AES 98 is, therefore, being run in concert with the ABI to provide distinct (but partly overlapping) datasets which will be processed via the AES and ABI methodologies respectively.

AES/ABI survey sample

The ABI sample will comprise about 78,000 enterprises (i.e. including both multiple-site organisations and singleunit businesses). These businesses were sent the new ABI survey form in respect of a survey date of December 11 1998. Included in this ABI survey are about 56,000 single-unit businesses (where there is no distinction between the enterprise and the local unit) for which the returned data will be held in common between ABI 98 and AES 98. In other words, these businesses will not receive an AES form but the data collected via ABI will be used to enhance the data

collected via AES 98. About 65,000 (single and multi-site) businesses have been sent AES 98 forms in respect of a September 1998 survey date. The discrepancy between the survey dates will be reconciled by means of adjusting one of the data-sets with a scaling factor (derived from data taken from the Short-Term Employment Survey).

Some large enterprises (both multi and single-site) will get both an AES form and an ABI form (albeit an abbreviated version).

Table 1 shows a brief comparison of data capture and survey methods for the two different surveys.

ABI estimation methodology

The ABI estimation methodology different from the AES. Part of that difference arises from the fact that whereas the AES focused on the local unit the ABI focuses on the enterprise (i.e. the business as a whole).

The returned data will be collated by SIC and size-band of the sample enterprises: each such 'two-digit SIC size-band' is regarded as a 'cell' for the purposes of the ABI estimation methodology at the enterprise level.

The basic formula for the process of creating estimates is that the total fo any cell is the sum of the returned data multiplied by 'a' and 'g' weights:

Table	Comparison of date capture and	d survey methods
Annual Er	nployment Survey	Annual Business Inquiry
Survey date	in September	Survey date in December
Great Britair	n coverage	United Kingdom coverage
Collects data	a on employees	Collects data on employment, i.e. employees p directors, working proprietors and other unpai workers
Collects data	a at local unit level	Collects data at enterprise level
Collects data	by male/female and full-time/part-time	Collects data by male/female and full-time/ part-time (i.e. the same as AES)
Collects info of each local	ormation on the business description unit (for SIC coding)	Derives enterprise level SIC codes direct from Inter Departmental Business Register
Estimation b PAYE data	y regression analysis based on	Estimation by a new technique ^a that relies on t Inter Departmental Business Register
a Described i	n detail in the article.	

• The 'a' weight gives a value to how representative the sampled businesses, in the cell, are of the total population of businesses, for that cell, on the Inter-Departmental Business Register (IDBR). For example, if the cell contained all of the businesses on the IDBR (i.e. it was full-cover) then the 'a' weight would be 'one'. If a cell contained one business out of ten businesses on the IDBR, the 'a' weight would be ten

• The 'g' weight gives a value to how representative the employment size of the selected businesses, in the cell, are of the employment size of he total population of businesses, for the cell, on the IDBR. What this neans, in effect, is that if the selected businesses are smaller than most of the businesses within the cell on the IDBR, then the 'g' weight will be greater than one. Conversely, larger than average businesses imply a 'g' weight of less than one.

The above process results in an estiate for each cell. Unlike the AES, the BI does not result in an individual imate for each non-surveyed or nonponding business. Instead, the turned data for each sampled/ turned business is grossed up to prouce a reliable aggregate result for the otal population for each cell.

BI small area estimation

By this stage in the process no account has been taken of the geographical distribution of the returned and/or estimated employment. The basic plan for achieving this is to use distribution of the total population the IDBR as a map. The employnent values held for businesses on the IDBR (known as their 'registered' employment) are not always the same as the employment values derived from survey returns. But the assumption is that the IDBR will be a reasonable guide to apportioning surveyed returns. Thus, crudely, if 10 per cent of the total employment value of an enterprise is located in local units in Wales, according to the IDBR, then 10 per cent of the ABI-derived aggregate would be allocated to Wales.

The nature of the survey means that for some very small cells (e.g. wards by industry) the sample size is too small to support good-quality estimates. For that reason 'minimum domains' have been set up. These are the lowest level at which robust estimates can be made. Minimum domains are generally NUTS 3 areas² by size-band by two-digit Standard Industrial Classification, for example 'Cambridgeshire CC x SIC 45 (construction) x 100+ employee jobs.' This is not to say, however, that estimates will not be available below this level of aggregation: the IDBR will be used to spread the minimum domain estimates across the smaller cells which comprise the minimum domain.

The basic aim of the method is to spread the known employment for a multi-site enterprise (i.e. taken from its ABI return) across the local units for that enterprise (i.e. as known from the IDBR) within each minimum domain. However, the method requires further sophistication at this point in order to cope with a consequence of the fact that ABI is pitched at the enterprise level. As has been already mentioned, large businesses straddle even the broadest of industrial definitions. The ABI uses SIC codes that are derived at the enterprise level. What this means is that a multisite enterprise-level SIC code may blanket local units that, if coded separately, would fall outside the range of the SIC code used for the parent enterprise. So to create an estimate for a given minimum domain (which is, after all, a patchwork of local units from various enterprises), one must first impute returns for the local units within the given domain. For the reasons given above, they cannot simply be decomposed from the enterpriselevel estimates.

Imputed local unit returns

The route from the ABI's enterpriselevel estimates to imputed returned data for local units is, again, via the IDBR. The IDBR holds a portrait of the geographical and industrial analysis of employment for each selected enterprise. To use a hypothetical example, it Technical report

Annual Business Inquiry 1998

is possible that 15 per cent of enterprise A's overall employment total on the IDBR lies within the research and development SIC at a plant in Liverpool. This same proportion can then be applied to the ABI-derived return for enterprise A to impute a returned value for that notional Liverpool local unit within the given minimum domain.

This mechanism will be flawed if the structures on the IDBR are out of date. One response to this threat will be via a planned new rolling survey called the Annual Register Inquiry, which will be used to refresh the IDBR information on business structures. But embedded in the ABI methodology itself is a way to measure local employment trends and use that information to improve the quality of local unit estimation. As was mentioned earlier, the ABI includes single-site businesses which are, in effect, local units. The local trend enhancement will highlight those single-site businesses that inhabit the same minimum domain, i.e. they fall within a NUTS 3 area and also share the same two-digit SIC and size-band. Trends in these businesses will be used to refine the weighting of estimation of all other local units that inhabit the same minimum domain as the highlighted group.

Final estimates for the minimum domains

The cell of estimation for small areas (i.e. the minimum domain) is a different cell from that which was used for the estimation process at the enterprise level. It follows that the estimation process must again go through the process of assigning 'a' and 'g' weights. Each minimum domain will contain:

- actual returned data from single-unit enterprises which fall within the domain:
- imputed local unit returned data derived as described above.

The fresh weights will inflate/deflate the sum of those returned/imputed data to take account of the local units for nonselected or non-responding enterprises which fall within the minimum domain.

The cells at the enterprise level will not sum to the same UK total, as the

Technical report

sum of the cells at the local unit level unless there is some final intervention. However, the returned data is common to both and so the UK totals will be broadly similar. The final reconciliation of the UK totals, via each route, is achieved by a constraining factor which is, in effect, a multiplier to scale each of the minimum domains.

Consultation

A small working group of officials from interested central government departments, as well as local government planners, will meet at the end of March to assess the quality of the early statistical products.

Sources of labour market statistics

MAIN SOURCES

Labour Force Survey

Much of the labour market data published are measured by the LFS. The concepts and definitions used in the LFS are agreed by the International Labour Organisation (ILO), an agency of the United Nations. The definitions are used by European Union member countries and members of the Organisation for Economic Co-operation and Development.

The LFS is the largest regular household survey in the United Kingdom. In any three month period, a nationally representative sample of approximately 120,000 people aged 16 or over in around 61,000 households are interviewed. Each household is interviewed five times, once every three months. The initial interview is generally done face-to-face by an interviewer visiting the address. Further interviews are done by telephone wherever possible. The survey asks a series of questions about respondents' personal circumstances and their labour market activity, with most questions referring to activity in the week before the interview. The first and fifth interviews also ask about earnings. Interviews are carried out continuously throughout the year and key results are published every month for the latest available three month period. Other data are available once a quarter or once or twice a year.

The LFS was carried out every two years from 1973 to 1983. The ILO definition was first used in 1984. This was also the first year in which the survey was conducted on an annual basis with results available for every spring quarter (March to May). The survey moved to a continuous basis in spring 1992 in Great Britain and in winter 1994/5 in Northern Ireland, with results published four times a year. Since April 1998, results are published 12 times a year for an average of each three month period. LFS data are published around six weeks after the period to which they refer.

The LFS three-monthly results can be compared in various ways over time, shown by the chart below. The shaded areas show the periods for which LFS results are available. Comparisons over time should be made with the periods shaded in the same patterns, e.g. January to March 1999 should be compared with January to March 1998 or April to June 1998. Comparing estimates for overlapping three-month periods can produce more volatile results which can be difficult to interpret. In order to make three-month on three-month comparisons, it is important to use seasonally-adjusted data.

Employer surveys

The ONS conducts a range of employer surveys, collecting information on their turnover and profits, and also the number of filled jobs.

The Annual Employment Survey (AES) is conducted annually in September to measure the number of employee jobs. The survey samples around 450.000 local units covering one-third of the worksites in the United Kingdom.

Short-term Turnover Employer Surveys are smaller surveys which are conducted every three months. The surveys are used to provide estimates of quarterly changes in the number of jobs between the annual surveys. For production industries surveys are conducted monthly, allowing estimates to be produced for each month. Around 9,000 production enterprises are sampled each month.

Both the AES and the Short-term Turnover Employer Surveys take a sample of businesses from the Inter-Departmental Business Register (IDBR). The IDBR holds details of all businesses that run a PAYE tax system or register for VAT.

The Monthly Wages and Salary Survey covers a sample of firms in Great Britain. The survey obtains details of the gross wages and salaries paid to employees, in respect of the last pay week for the weekly paid, and for the calendar month for the monthly paid. The sample covers the wage bill for some 9 million employees. It is used to calculate the Average Earnings Index.

Administrative records

Labour market data on the number of people claiming unemployment-related benefits and Jobcentre vacancies are derived from administrative records.

Claimant count data are provided by the Benefits Agency. Job Seeker's Allowance (JSA) replaced both Unemployment Benefit and unemployment-related Income Support on 7 October 1996. Up to 6 October the claimant count figures included those who claimed Unemployment Benefit, Income Support or National Insurance credits. A seasonally-adjusted consistent claimant count series is available from 1971. The claimant count records the number of people claiming unemployment-related benefits on one particular day each month. Claimant count figures are announced five weeks after the date to which they refer.

Data on vacancies are produced by the Employment Service (ES) as a by-product of their Labour Market System (LMS). LMS is the computer system that manages the currency of vacancies on display, controls their circulation around Jobcentres and identifies those for liaison action with employers A consistent vacancies series is available from 1985

USING DATA SOURCES

Because the different sources of labour market data have different strengths and limitations, it follows that they are best used for different purposes. This section identifies the source of data that ONS recommends using for different types of analysis of three aspects of the labour market: employment. unemployment, and earnings.

Employment

The LFS provides a more complete measure of employment than the Workforce Jobs series, but the Workforce Jobs series probably provides a more accurate industrial breakdown than the LES

To gain an idea of the extent of work being performed in the UK, the LFS is preferred. The LFS is also the only source of detailed information about the characteristics (occupations, homeworking work patterns and so on) of people's work - except for the industry in which people work, where the Workforce Jobs series is likely to be more accurate and consistent with other national economic series

Unemployment

The LFS provides a more complete measure of unern ployment (under the II O definition) than the claima count (which measures benefit receipt), especially f women, and is better-suited to international compaisons. The claimant count is more useful as a way o assessing unemployment in small areas (below the level of regions); it is also useful as a timely indicator of up-to-date changes in unemployment.

Earnings

For monthly estimates of changes, the Average Earnings Index is most suitable. For annual changes. the New Earnings Survey should be used. For estimates of levels (amounts workers earn each week or each hour), the sources are the NES and LFS. The NES is preferred as a source of the earnings of fulltime employees, and of the hourly earnings of a employees. The LFS is preferred as a source about the earnings of part-time employees. LFS earnings esti mates are published in the LFS Quarterly Supplement

Definitions

The terms used in the tables are defined more fully in the periodic articles in Labour Market Trends that relate to particular statistical series

ILO unemployment rate

The percentage of economically active people who are unemployed on the ILO measure. Can be calculated for any population group.

Claimant count rate

The number of claimants resident in an area expressed as a percentage of the sum of claimants and workforce iobs in the area.

ECONOMIC ACTIVITY

Economically active

The economically active population are those who are either in employment or ILO unemployed.

Economic activity rate

The number of people who are in employment or unemployed as a percentage of the total population aged 16 and over. Can be calculated for any population group.

ECONOMIC INACTIVITY

Economically inactive

Economically inactive people are out of work, but do not satisfy all the criteria for ILO unemployment, such as those in retirement and those who are not actively seeking work

Economic inactivity rate

EARNINGS

Earnings

account, whether or not they have employees.

- Employment rates can be presented for any population
- group as the proportion of that group who are in
- yment. The main presentation of employment
- is the proportion of the population of working age
- (16-59 for females and 16-64 for males) who are in employment.

UNEMPLOYMENT

ILO unemployment

- The International Labour Organisation (ILO) definition of
- unemployment covers people who are: out of work,
- want a job, have actively sought work in the previous
- four weeks and are available to start work within the next fortnight; or out of work and have accepted a job
- that they are waiting to start in the next fortnight.

Count of claimants of unemploymentrelated benefits (claimant count)

The claimant count records the number of people claiming unemployment-related benefits. These are currently the Jobseeker's Allowance (JSA) and National Insurance credits, claimed at Employment Service local offices. People claiming JSA must declare that they are out of work, capable of, available for and actively seeking work during the week in which the claim is made. They enter into a Jobseeker's Agreement setting but the action they will take to find work and to improve their prospects of finding employment

Where figures have been rounded to the final digit, there may be an apparent slight discrepancy between the sum of the constituent items and the total as shown. Although figures may be given in unrounded form to facilitate the calculation of percentage changes, rates of change etc by users. this does not imply that the figures can be estimated to this degree of precision, and it must be recognised that they may be the subject of sampling and other errors.

A measure of the gross remuneration people receive in return for work done. It includes salaries and bonuses but does not include non-monetary perks such as benefits in kind. This differs from income, which is the amount of

nil or negligible (less than half the

series revised from indicated entry

money received from all sources. Income includes interest from building society and bank accounts, dividends from shares, benefit receipts trust funds etc.

Average Earnings Index

Average earnings are obtained by dividing the total paid by the total number of employees paid, including those on strike. The headline rate is the centred average of the annual change in the seasonally-adjusted series over the latest three months, and replaces the underlying rate of change (see 'Improvements in the Average Earnings Index.' Labour Market Trends. May 1998, pp259-63).

HOURS WORKED (New Earnings Survey) Normal weekly hours

The time which an employee is expected to work in a normal week excluding all overtime and main meal breaks.

Weekly hours worked

The actual hours worked during the reference week and hours not worked but paid for under guarantee agreements.

HOURS WORKED (Labour Force Survey)

Respondents to the LFS are asked a series of questions enabling the identification of both their usual hours and their actual hours during the reference week, excluding meal breaks, but including paid and unpaid overtime.

OTHER DEFINITIONS General index of retail prices

The Retail Prices Index measures the change in the

prices of goods and services bought for the purpose of consumption by the vast majority of households in the UK. The general index includes virtually all types of household spending as detailed in Table H.12.

Labour disputes

Statistics cover disputes (strikes) connected with terms and conditions of employment. Workers involved and working days lost relate to persons both directly and indirectly involved at the establishments where the disputes occurred.

Productivity

The number of units of output (measured by the Index of Production for the manufacturing sector and by Gross Domestic Product for the whole economy) produced by each filled job.

Standard Industrial Classification (SIC)

The classification system used to provide a consistent industrial breakdown for UK official statistics. It was revised in 1968, 1980 and 1992. The SIC 1992 classification splits businesses into 17 sections. A-Q. The breakdown includes the following categories: Production industries - SIC 1992 Section E including Manufacturing (Section D); Service industries - SIC 1992 Sections G-O

Standard Occupational Classification (SOC)

The classification system used to provide a consistent occupational breakdown for UK official statistics. This system was introduced in 1991

Unit Wage Costs

A measure of the cost of wages and salaries in producing a unit of output.

Jobcentre vacancies

A job opportunity notified by an employer to a Jobcentre or careers office (including 'self-employed' opportunities created by employers) which remained unfilled on the day of the count.

Technical Note COMPARISONS OF LFS DATA

01.3 recommends that non-overlapping periods are always used for comparisons over time.

LFS data are based on statistical samples (see Sources, p S2) and, as such, are subject to sampling variability. If we drew many samples, each would give a different result. The ranges shown for the LFS data in the table below represent '95 per cent confidence intervals'. We would expect that in 95 per cent of samples the range would contain the true value. The ranges are approximated from non-seasonally adjusted data for Oct-Dec 1998 in line with research on the topic. For more information, see the *Guide to Labour* Market Statistics Releases, or the LFS Quarterly Supplement.

	Level (000s)	Sample variability	Change on quarter	Sample variability	Change on year
employment	27,286	±155	122	±113	305
nployment rate	73.8%	±0.3%	0.2%	±0.2%	0.6
Ounemployment	1,790	±53	-15	+56	-103
O unemployment rate	6.2%	±0.2%	-0.1%	±0.2%	-0.4
conomically active	29,076	±152	107	±111	202
conomic activity rate	78.8%	±0.3%	0.2%	±0.2%	0.3

The sample design of the LFS enables estimates for any three consecutive months to be calculated. ONS began publication of these estimates in April 1998. The most reliable comparison is one between non-overlapping periods. For the latest data, compare with data from three months previously e.g. December to February data with that for September to November rather than November to January. Due to the overlap of two months, the latter comparison would actually just compare the single months of November and February, but the data are not robust enough to make this comparison. This can lead to unreliable conclusions about change. For further details see article by Richard Laux, pp59-63, *Labour Market Trends*, February 1998.

Technical Note COMPARISONS OF LFS DATA

Thousands

ONS recommends that non-overlapping periods are always used for comparisons over time.

Sampling variablity is similar to that as produced on Table A.1, S7. For more detailed analyses please see the Labour Force Survey Quarterly Supplement.

Source: Labour Force Survey. Labour Market Statistics Helpline: 0171 533 6094.

The sample design of the LFS enables estimates for any three consecutive months to be calculated. ONS began publication of these estimates in April 1998. The most reliable comparison is one between non-overlapping periods. For the latest data, compare with data from three months previously e.g. December to February data with that for September to November rather than November to January. Due to the overlap of two months, the latter comparison would actually just compare the single months of November and February, but the data are not robust enough to make this comparison. This can lead to unreliable conclusions about change. For further details see article by Richard Laux, pp59-63, *Labour Market Trends*, February 1998.

Experimitions of terms used will be found on page S3. Workforce jobs (formerly workforce in employment) are calculated by summing employee jobs, self-employment jobs from the LFS. HM Forces and government-supported trainees. HM Forces figures, provided by the Ministry of Defence, represent the total number of UK service personnel, male and female, in HM Forces, wherever serving and including those o release leave. The numbers are not subject to seasonal adjustment. Estimates of self-employment jobs are based on the results of the Labour Force Survey. The Northern Ireland estimates are not seasonally adjusted. Includes all participants on government training and employment programmes who are receiving some work experience on their placement but who do not have a contract of employment (those with a contract are included in the employee jobs series). The numbers are not subject to seasonal adjustment. Employee jobs, self-employment trained is the employee intervence and trainees. Estimates of part-time employees in the United Kingdom are only available on a quarterly basis since December 1992. The Northern Ireland component is not seasonally adjusted. Deviced

StatBase[®]: the Source for all your official data needs

Need official statistics? But not sure what's available or where to look?

Find all the information you need when you need it with **StatBase**® the new on-line electronic catalogue and data delivery service via the Internet.

For the first time in one place **StatBase**[®] offers you **free** round-the-clock access to:

the most comprehensive source of government and official tatistics available

essential information on how to obtain the publications and ata you need

a growing database of key economic and social statistics many free of charge!)

integrated software packages that allow you to print, download, manipulate, chart time series and carryout cross sectional analyses of the statistics held in the database.

StatBase[®] is available at:

www.statistics.gov.uk

or fax us on 01633 812762 for your free information pack.

Note: Estimates for groups of industry classes are now seasonally adjusted from June 1978 for quarterly data and from September 1984 for monthly data. For unadjusted figures, please see Tables B. 3 and B. 14. These figures do not cover all employees in national and local government. They exclude those engaged in, for example, building, education and health. Members of HM Forces are excluded. Excludes private domestic service. See note on pS16.

Gross value added for whole economy. The workforce jobs series comprises: employee jobs, self-employment jobs, HM Forces and government supported trainees. This series is used as a denominator for the productivity calculations for the easons explained on page 56 of the August 1988 issue of *Employment Gazette*. The indices have been rebased from 1990=100 to 1995=100, in common with other economic series. Figures on a 1990=100 basis were last published in *Labour Market Trends*, October 1998.

The latest national and regional seasonally-adjusted claimant count figures are provisional and subject to revision, mainly in the following month. Revised.

National and regional claimant count rates are calculated by expressing the number of claimants as a percentage of the estimated total workforce (the sum of claimants, employee jobs, self-employed, HM Forces and participants on work-related government training programmes) at mid-1997 for 1997, 1998 and 1999 figures and at the corresponding mid-year estimates for earlier years. The seasonally-adjusted series takes account of past discontinuities to be consistent with the current coverage of the count (see Employment Gazette, December 1990, p608 for the list of discontinuities taken into account, and pS16 of the April 1994 issue). To maintain a consistent assessment, the seasonally-adjusted series relates only to claimants aged 18 and over.

Labour Market Statistics Helpline: 0171 533 6094

Travel-to-Work Areas (TTWAs) are as defined in May 1998. A list of the ward composition of the TTWAs is available from the regional and local labour market statistics branch on 0171 533 6159. Claimant count rates are calculated as a percentage of the estimated total workforce jobs (the sum of employee jobs, self-employment jobs, HM Forces and government-supported tra plus claimants, and as a percentage of estimates of employee jobs and claimants only. All the TTWA rates shown are calculated using mid-1997 based denominators. Rates for the above TTWAs back to January 1997 and rates for the 1984 TTWAs are available from the Office for National Statistics Nomis® database. Data on claimant count for Assisted Areas, which were redefined on 1 August 1993, are available from the Office for National Statistics Nomis® database. Claimant count rates are available only for those Assisted Areas which map precisely to 1984-based Travel-to-Work Areas.

Claimant count rates are calculated as a percentage of the estimated total workforce (the sum of employee jobs, claimants, self-employed, HM Forces and participants on work-related government training programmes) and as a percentage of estimates of employee jobs and the claimants only. All the county rates shown are calculated using mid-1997 based denominators.

Thousands

The claimant count flow statistics are described in *Employment Gazette*, August 1983, pp351-8. Flow figures are collected for four or five-week periods between count dates; the figures in the table are converted to a standard 41/₃ week month. The latest national seasonally-adjusted claimant count figures are provisional and subject to revision, mainly in the following month. Revised.

JUVOS cohort is a 5% sample of computerised claims.
 Latest claims in this table started between 9 July 1998 and 8 October 1998 inclusive.
 The videst claims in this table must have started after 14 July 1988.
 The widest 95% confidence interval for the regional percentages is +/-2.6 percentage points (Merseyside).
 The widest 95% confidence interval for the male/female percentages is -/-0.9 percentage points.
 All claims have been grossed by a factor of 20 to represent the population.

Notes: 1 The figures on national definitions are not directly comparable due to differences in coverage and methods of compilation.
 2 Unemployment as a percentage of the total labour force. The standardised unemployment rates are based on national statistics but have been adjusted when necessary, and as far as the available data allow, to bring them as close as possible to the internationally agreed ILO definitions. The standardised rates are therefore more suitable than the national figures for comparise the levels of unemployment between countries. The OECD is now using Eurostat unemployment rates for all EU countries. Rates for all other countries are calculated by the OECD.
 The following symbols apply only to the figures on national definitions.
 + Numbers registered at employment offices. Rates are calculated as percentages of civilian labour force, except Greece, which excludes civil servants, professional people, and farmers.

Relationship between columns: 1= 2+8; 2= 3+4+5+6+7 * Denominator = all persons in the relevant age group. Each series is seasonally adjusted independently and therefore the sum of the series will not necessarily equal the totals.

Relationship between columns: 2=3+4; 4=5+13; 5=6+7=8+9+10+11+12; 13=14+15.

Note: Due to a questionnaire routeing error only those aged 16-59 were asked their reasons for inactivity in 1992. Therefore 1992 figures are inaccurate. These figures were mistakenly included in this table in the May to July 1998 issues.

Social Focus on Women and Men

How do the lives of men and women differ at work, in the home and at play?....

One of the most comprehensive studies yet undertaken of this key topic is now available. Compiled by the Office for National Statistics and the Equal Opportunities Commission, Social Focus on Women and Men examines the different life experiences of the two genders under 14 subject headings. Topics covered include:

- Population
- Households
- Families and homes
- Education and training
- Economic activity and unemployment
- Type of job
- Work and family

Social Focus on Women and Men brings together data from many sources in 80 pages of text, tables and charts. It also includes lists of references, further reading and useful contact points.

The Focus is an invaluable resource for anyone monitoring social change, including researchers, policy-makers, commentators, academics and students.

This is the sixth report in the Social Focus series; the other topics covered are women, children, ethnic minorities, families and the unemployed.

Social Focus on Women and Men price £30 ISBN 0 11 21069 9 Published by The Stationery Office tel 0171 873 9090 or fax 0171 873 8200

E.1, E.3, E.11, E.21 AVERAGE EARNINGS INDEX, NEW EARNINGS SURVEY AND UNIT WAGE COST TABLES

Tables E.1, E.3, E.11 and E.21

The publication of the Average Earnings Index was suspended pending the investigations detailed in the News Release ONS (98) 360 issued on 2 November 1998. The scheduled reinstatement on 2 March 1999 is after this issue has gone to press. For further details, see news items on p591, Labour Market Trends, December 1998 and p91 of this issue, or contact ONS Press Office on 0171 533 5725.

AEI data will reappear in the Labour Market Data section of the April issue.

 a Employment Training.
 Employment Training and Employment Action.

 Training for Work.
 1996-97 starts and in-training figures include Pre-Vocational Pilots (PVPs).

 e Pre-Vocational Training (PVT) is part of mainstream Work-based training for adults (WBTA) from April 1997 onwards.

 f Modern Apprenticeships was launched as an initiative in September 1994 and was fully operational from April 1995.

 g National Traineeships were introduced nationally in September 1997 (Welsh figures for National Traineeships are not available for 1997-98).

 At the point of entry to training, trainees were identified as non-employed status and not pre-vocational.

 j At the point of entry to training, trainees were identified as employed status (including self-employed).

Source: OT follow-up survey

Leavers to September 1990 surveyed three months after leaving. Leavers in October and November 1990 surveyed in June 1991. Leavers from December 1990 surveyed six months after leaving. Information on levels of qualifications is not available for 1990-91 leavers. The way that data on qualifications gained are collected was changed from August 1991. The effect appears to have been to decrease the proportion recorded as gaining I'll qualifications, but to increase by a similar amount the proportion gaining part qualifications. Data for 1990-1991 and 1991-92 leavers are not strictly comparable with those for later years. From April 1995 the definition of YT leavers changed, no longer counting those making planned transfers from one training provider to another as leavers. Many of these transferring trainees will no have gained a job or qualification or completed their training. Therefore the change in definition will increase slightly the proportions with jobs and qualification and completing their training. trainees will not

About one third of all vacancies nationally are notified to Jobcentres. These could include some that are suitable for young people and similarly vacancies notified to careers offices could include some for adults. The figures represent only the number of vacancies notified by employers and remaining unfilled on the day of the count. Because of possible duplication and also due to a difference between the timing of the two counts, the two series should not be added together. Annual averages for vacancies at careers offices for GORs are unavailable prior to 1996. Note

See footnote * to Table G.1.

Provisional
 Revised
 Series revised from indicated entry onwards.
 Data values from which percentage changes are calculated may have been rounded.
 For most indicators two series are given, representing the series itself in the units stated and the percentage change in the series on the same period a year earlier.
 Not seasonally adjusted.
 The percentage change is for the monthly data is the percentage change between the three months ending in the month shown and the same period a year earlier.
 Production industries: SIC divisions 1 to 4.
 Manufacturing industries: SIC divisions 2 to 4.

Note: Indices are given to one decimal place to provide as much information as is available although accuracy is reduced at lower levels of aggregation. For this reason, annual percentage changes for individual sections are given rounded to the nearest whole number.
 The taxes excluded are council tax, VAT, duties, vehicle excise duty, insurance tax and airport tax.
 For general notes see *Table H.13*

Average retail prices on January 19 for a number of important items derived from prices collected by the Office for National Statistics for the purpose of the General Index of Retail Prices in more than 146 areas in he United Kingdom are given below.

Average prices on Jar	nuary	19 1999			column belov
Item		Number of quotations	Average price (pence)	Price range within which 80 per cent of quotations fell (pence)	Item

Or Scottish equivalent. Average price estimates include prices of delivered milk and shop-bought milk. However, 80 per cent price range includes only shop-bought milk.

General Notes - Retail Prices

The responsibility for the Retail Prices Index was transferred in uly 1989 from the Employment Department to the Office for National Statistics (formerly Central Statistical Office). The RPI is now published in full in the ONS Business Monitor MM23.

Structure

With effect from February 1987 the structure of the published omponents was recast. In some cases, therefore, no direct omparison of the new component with the old is possible. The lationship between the old and the new index structure is shown Employment Gazette, p379, September 1986.

Definitions

RETAIL PRICES Average retail prices of selected items

It is only possible to calculate a meaningful average price for fairly standard items; that is, those which do not vary between retail outlets.

The averages given are subject to uncertainty, an indica-tion of which is given in the ranges within which at least four-fifths of the recorded prices fell, given in the final low.

		Number of quotations	Average price (pence)	Price range within which 80 per cent of quotations fell (pence)

For the February, March and April 1988 indices the weights used for seasonal and non-seasonal food were 24 and 139 respectively. Thereafter the weight for home-killed lamb (a seasonal was increased by 1 and that for imported lamb (a non-seasonal item) correspondingly reduced by 1, in the light of new information about the relative shares of household expenditure.
 The nationalised industries index is no longer published from December 1989, see also General Notes under *Table H.13*.
 Note: The structures of the published components of the index were recast in February 1987, (see General Notes under *Table H.13*).

Notes: 1 Harmonised Indices of Consumer Prices (HICPs) are being calculated in each member state of the European Union for the purpose of international comparisons. This is in the context of one of the convergence criteria for monetary union as required by the Maastricht treaty. The rules underlying the construction of the HICPs for EU member states were published in a Commission Regulation of 9 September 1996. The HICPs replace the Interim Indices of Consumer Prices which were published by Eurostat in a monthly news release.
 2 Figures for Irish Republic for 1996 are only available on a quarterly basis.
 3 Percentage change figures for 1996 are estimated.

Notes: 1 Comparisons of consumer price indices are affected by differences in national concepts and definitions especially in the treatment of housing costs. Consumer price indices excluding housing costs are therefore given as the best available basis for comparison for non-EU countries. This is in accordance with a resolution adopted by the 14th International Conference of Labour Statisticians that countries should "provide for the dissemination at the international level of an index which excludes shelter, in addition a all-items index." Figures are given for each country on the nearest basis to the UK series "All items excluding housing." Where necessary the figures in this table have been estimated by the ONS using data kindly supplied by other countries. in addition to

2 The definition of housing costs varies between countries. The figures shown for most countries exclude owner-occ and lighting are also excluded. renairs and maintenance. For Canada, fi

3 Figures for the four EU member states have been provided in this table for comparison with non-EU countries are the Harmonised Indices of Consumer Prices shown in Table H.21.

From the April issue, this table will no longer appear. The data will be available by contacting Retail Prices, D2/13, Office for National Statistics, 1 Drummond Gate, London, SW1V 2QQ (tel: 0171 533 5853).

ONS STATFAX gives anyone with a fax machine instant access to the latest labour market statistics. The first two pages of the latest monthly LMS National Press Notice are available within moments of the official release time of 9.30am. The number to ring is 0336 416036. Calls are charged at 50p per minute. Contact ONS on 0171 533 6363 if you have any problems.

Social Trends 29

Each year Social Trends provides a comprehensive guide to UK society today, showing how our lives have changed over the years and reflecting the realities of contemporary lifestyles.

Now available, Social Trends 29 contains 13 chapters on topics ranging from population and health to housing and transport. Over half of the tables and charts in the chapters are new compared with the previous edition. This year's edition also features a special article on drugs in the UK.

Social Trends 29 is an invaluable resource for anyone involved in social policy, marketing, advertising, research, journalism, and teaching, as well as anyone interested in how we live today.
